this second edition of a standard numerical analysis text retains organization of the original edition but all sections have been revised some extensively and bibliographies have been updated new topics covered include optimization trigonometric interpolation and the fast fourier transform numerical differentiation the method of lines boundary value problems the conjugate gradient method and the least squares solutions of systems of linear equations contains many problems some with solutions

in 1979 i edited volume 18 in this series solution methods for integral equations theory and applications since that time there has been an explosive growth in all aspects of the numerical solution of integral equations by my estimate over 2000 papers on this subject have been published in the last decade and more than 60 books on theory and applications have appeared in particular as can be seen in many of the

chapters in this book integral equation techniques are playing an increas ingly important role in the solution of many scientific and engineering problems for instance the boundary element method discussed by atkinson in chapter 1 is becoming an equal partner with finite element and finite difference techniques for solving many types of partial differential equations obviously in one volume it would be impossible to present a complete picture of what has taken place in this area during the past ten years consequently we have chosen a number of subjects in which significant advances have been made that we feel have not been covered in depth in other books for instance ten years ago the theory of the numerical solution of cauchy singular equations was in its infancy today as shown by golberg and elliott in chapters 5 and 6 the theory of polynomial approximations is essentially complete although many details of practical implementation remain to be worked out

presents the state of the art in the study of fast multiscale methods for solving these equations based on wavelets

the volume provides results from the latest methodological developments in data analysis and classification and highlights new emerging subjects within the field it contains articles about statistical models classification cluster analysis multidimensional scaling multivariate analysis latent variables knowledge extraction from temporal data financial and economic applications and missing values papers cover both theoretical and empirical aspects

contains research articles on the development and analysis of numerical methods including their convergence stability and error analysis as well as related results in functional analysis and approximation theory computational experiments and new types of numerical applications
