this book is the second edition of the one originally published in 2016 which focused on state of the art microfluidic research in medical and biological applications similar to the first

edition beginners in the field undergraduates engineers biologists medical and pharmaceutical researchers will easily learn to understand microfluidic based medical and biological applications because a wide range of topics is summarized here it also helps experts to learn more about fields outside their own specialties in this second edition significant revisions have been made to chapters covering technologies that have seen major advancements such as acoustofluidics protein crystallography organ on a chip systems nanopore sensing and paper based microfluidics in addition the chapters on cancer diagnosis using exosomes and single cell sequencing using droplet microfluidics which are attracting attention as new technologies have been newly added readers will be convinced that microfluidic devices have great potential for medical and biological applications

this book addresses the basic understanding of food contaminants and their sources followed by the techniques to measure food safety and quality it is divided into four parts part a sources of contaminants in foods their associated health risks and integrated management and alternative options to minimize contaminants part b technological assessment of conventional methods and selected advanced methods for the detection identification and enumeration of microbial contaminants part c technological assessment of different chemical measurements techniques and part d technological assessment of different instrumental techniques to assess sensory properties of foods food safety is a growing concern due to the increase in food borne illnesses caused by food adulteration excessive use of pesticides use of chemical preservatives and artificial fruit ripening agents microbial contaminations and improper food handling chemical contaminants in food could be transferred from environmental or agrochemical sources personal care products and other by products of water disinfects in addition microbial food safety can be threatened due to the presence of many pathogens such as salmonella escherichia coli clostridium botulinum staphylococcus aureus and listeria monocytogenes in foods globally strict regulations are imposed to limit the potential contaminants in foods development of accurate rapid and inexpensive approaches to test food contamination and adulteration would be highly valued to ensure global food safety there are existing processes to ensure safety of food products from chemical and microbial contaminants apart from the existing measurement technologies varieties of new techniques are also being emerged and these could be potential to ensure food safety and quality in addition to chemical and microbial properties sensory properties such as texture mouth feel flavor and taste are among the most important attributes of food products to ensure their acceptability by consumers two approaches are available to evaluate sensory properties of food products namely subjective and objective analyses the responses are perceived by all five senses smell taste sight touch and hearing the approach used in sensory evaluation varies depending on the types of foods and the ultimate goal of the testing sensory attributes are the most important quality parameters after ensuring the safety of foods
