this volume parts a and b contains the edited papers presented at the annual review of progress in quantitative nondestructive evaluation held at the university of california san diego in lajolla august 3 8 1986 the review was organized and sponsored by the center for nde at iowa state university and the ames laboratory in cooperation with the office of basic energy sciences usdoe and the materials

laboratory at wright patterson air force base approximately 400 attendees a new record representing various government agencies industry and universities participated in the technical presentations poster sessions and discussions this review with its wide ranging interchange of technical information stands as one of the most comprehensive in the field of nde research and engineering in order to present the reader with a more useful document we have organized the symposium papers in these proceedings by subject rather than by the order of presentation at the review topical subject headings have been selected under which the large majority of papers would reasonably fall here again we have revised the format used in former years to accommodate an evolving focus of interest in the field these categories cover a broad spectrum of research in nde and encompass activities from fundamental work to early engineering applications in the following paragraphs we offer a brief summary of the research presented in these proceedings

this book provides students with a thorough theoretical understanding of electromagnetic field equations and it also treats a large number of applications the text is a comprehensive two semester textbook the work treats most topics in two steps a short introductory chapter followed by a second chapter with in depth extensive treatment between 10 to 30 applications per topic examples and exercises throughout the book experiments problems and summaries the new edition includes modifications to about 30 40 of the end of chapter problems a new introduction to electromagnetics based on behavior of charges a new section on units matlab tools for solution of problems and demonstration of subjects most chapters include a summary the book is an undergraduate textbook at the junior level intended for required classes in electromagnetics it is written in simple terms with all details of derivations included and all steps in solutions listed it requires little beyond basic calculus and can be used for self study the wealth of examples and alternative explanations makes it very approachable by students more than 400 examples and exercises exercising every topic in the book includes 600 end of chapter problems many of them applications or simplified applications discusses the finite element finite difference and method of moments in a dedicated chapter

this book published as a supplement to the journal compel contains the proceedings of the international symposium and team workshop 3dmag held in okayama from 11 13 september 1989 it will provide a reference source for all those in the field by presenting an up to date and comprehensive view of current work in this area
