this experiment was designed to compare reaction times to brake signals when they appear with red or yellow turn signals
the laboratory study simulated a daytime driving condition the subject's task was to respond as quickly as possible to the
onset of peripherally presented brake lamps but not to turn signals while engaged in a central tracking task there were
three lamp conditions brake lamps alone brake lamps while turn signal was on and a turn signal lamp alone thus the subject's
task required an immediate response in the first condition a delayed response in the second only after the brake lamps
came on not to the turn signal and no response in the third condition turn signals were presented at two levels of
luminous intensity the results showed that reaction times to brake signals were significantly shorter when the brake

signals were presented in the context of yellow turn signals than when they were presented in the context of red turn signals averaged over both levels of luminous intensity and conditions with and without turn signals the difference between yellow and red was 110 ms the colors of turn signals had an effect whether or not the turn signal was on but the effect was greater when it was older subjects were affected more by the color of turn signals than were younger subjects in conclusion yellow turn signals are beneficial in situations simulated in this experiment however the present findings are directly applicable only to a situation where all vehicles have yellow turn signals and tail lamps are not energized

this study dealt with five types of left turn signal phasing permissive leading exclusive lagging exclusive leading exclusive permissive and lagging exclusive permissive the objectives of this research project were to 1 develop a research work plan to conduct a statistically valid study for the development of numerical warrants for left turn movements and 2 prepare a database of available information on signalized intersections and select the intersections to be used in the future study this report describes the database of arizona signalized intersections created in this project the findings on left turn accident rates for different types of left turn phasing using a nonrandom sample and results of a validation study of the texas computer simulation model it also presents a research work plan for a future research project
