the early 20th century in italy was a crucial period in its history this book surveys the important issues and topics of the period including the origins and rise of fascism mussolini as prime minister and dictator the totalitarian state foreign policy and world war ii it also examines how italian fascism compared to other inter war dictatorships

pioneering studies conducted in the 1980 s laid the foundation for the hypothesis that axonal regeneration is

limited by CNS myelin and the identification of myelin associated glycoprotein MAG, Nogo and oligodendrocyte myelin glycoprotein OMgp as inhibitors of neurite outgrowth firmly established myelin as a key factor in regenerative failure. Mechanistically it has been shown that MAG, Nogo and OMgp mediate inhibition by binding to either Nogo receptor (NGR) or paired immunoglobulin receptor type B (PIRB) and initiating a signaling cascade that culminates in the activation of RhoA. Since the discovery of these proteins there has been tremendous interest in identifying compounds and molecular mechanisms that are capable of overcoming myelin mediated inhibition. Many studies have focused on pharmacological antagonism of receptors and signaling intermediates while others have sought to identify and enhance endogenous pro-regenerative pathways. The most notable example of the latter is the conditioning lesion effect which led to the discovery of cAMP's ability to overcome inhibition by MAG and myelin. Many of the agents tested in these studies have been shown to promote axonal regeneration in vivo and this research topic allows researchers to share information about new treatments that have been developed in both academia and industry. As we look toward the future it is becoming increasingly clear that reversal of myelin mediated inhibition alone will not be sufficient to produce functional recovery from spinal cord injury and that other factors such as astroglial scarring, the expression of chondroitin sulfate proteoglycans, neuronal cell death and lack of neurotrophic support must also be taken into consideration. Combinatorial approaches therefore hold a great deal of promise and we hope to initiate a dialogue on how stem cell transplantation, chondroitinase ABC gene therapy, growth promoting agents and other methods can be combined to optimize functional recovery. We introduce this topic in honor of the life and work of Dr. Marie T. Filbin (1955-2014). Through these articles we highlight past achievements in the field, novel findings, unanswered questions and innovative ideas that we hope will lead to new advances in axonal regeneration.
