natural selection is an immense and important subject yet there have been few attempts to summarize its effects on natural populations and fewer still which discuss the problems of working with natural selection in the wild these are the purposes of john endler s book in it he discusses the methods and problems involved in the demonstration and measurement of natural selection presents the critical evidence for its existence and places it in an evolutionary perspective professor endler finds that there are a remarkable number of direct demonstrations of selection in a wide variety of animals and plants the distribution of observed magnitudes of selection in natural populations is surprisingly broad and it overlaps extensively the range of values found in artificial selection he argues that the common assumption that selection is usually weak in natural populations is no longer tenable but that natural selection is only one component of the process of evolution natural selection can explain the change of frequencies of variants but not their origins

in his groundbreaking book natural selection charles darwin explained his theory that evolution is driven by adaptation of species to their environmental surroundings from the tiniest microbe to the largest whale all organisms have changed over vast expanses of time due to the forces of natural selection this new title in the science foundations series provides an overview of the processes and causes that drive natural selection and the principles that explain how it operates using numerous diverse organisms as examples natural selection promotes a solid understanding of how organisms change over the course of generations and how current biodiversity came to be

this new textbook for students taking courses in evolution is addressed to one of the most difficult questions evolutionary biology that of selection covering both artificial and natural selection the author has written a short readable text that will appeal to students and professionals alike how the nature of the process determines the nature of evolutionary change

natural selection is the process which being the most important factor of evolution promotes rising of adaptability and prevents destructive consequences of all other processes the concept of natural selection is a discordant problem of evolutionary human genetics despite popularity of a hypothesis of neutral evolution the majority of scientists consider that selection has played main role in evolution of species and has generated all biological diversity of human populations this book presents research on natural selection and genetic drift the author of the first chapter provides an all embracing macroevolutionary perspective on the processes of the evolution of life and culture on earth the author investigates a complementary form of natural selection that diverges from the traditional form in that it is acting independently of the external environment the next chapter discusses natural selection and diabetes mellitus the last chapter examines how the genetic drift among native people from south american the gran chaco region affects interleukin 1 receptor antagonist variation

this book summarizes the knowledge in the field of methods to identify signatures of natural selection a number of mathematical models and methods have been designed to identify the fingerprints of natural selection on genes and genomes such methods are provided in a simple and direct way so that students of different disciplines can navigate thr
