introducing stone priestley duality theory and its applications to logic and theoretical computer science this book equips graduate students and researchers with the theoretical background necessary for reading and understanding current research in the area after giving a thorough introduction to the algebraic topological logical and categorical aspects of the theory the book covers two advanced applications in computer science namely in domain theory and automata theory these topics are at the forefront of active research seeking to unify semantic methods with more algorithmic topics in finite model theory frequent exercises punctuate the text with hints and references provided

this book was first published in 2001 it provides an introduction to fourier analysis and partial differential equations and is intended to be used with courses for beginning graduate students with minimal prerequisites the authors take the reader from fundamentals to research topics in the area of nonlinear evolution equations the first part of the book consists of some very classical material followed by a discussion of the theory

of periodic distributions and the periodic sobolev spaces the authors then turn to the study of linear and nonlinear equations in the setting provided by periodic distributions they assume only some familiarity with banach and hilbert spaces and the elementary properties of bounded linear operators after presenting a fairly complete discussion of local and global well posedness for the nonlinear schrödinger and the korteweg de vries equations they turn their attention in the two final chapters to the non periodic setting concentrating on problems that do not occur in the periodic case
