historically the scientific method has been said to require proposing a theory making a prediction of something not already known testing the prediction and giving up the theory or substantially changing it if it fails the test a

theory that leads to several successful predictions is more likely to be accepted than one that only explains what is already known but not understood this process is widely treated as the conventional method of achieving scientific progress and was used throughout the twentieth century as the standard route to discovery and experimentation but does science really work this way in making 20th century science stephen g brush discusses this question as it relates to the development of science throughout the last century answering this question requires both a philosophically and historically scientific approach and brush blends the two in order to take a close look at how scientific methodology has developed several cases from the history of modern physical and biological science are examined including mendeleev s periodic law kekule s structure for benzene the light quantum hypothesis quantum mechanics chromosome theory and natural selection in general it is found that theories are accepted for a combination of successful predictions and better explanations of old facts making 20th century science is a large scale historical look at the implementation of the scientific method and how scientific theories come to be accepted
