the term superscalar describes a computer architecture that achieves performance by concurrent execution of scalar instructions superscalar architectures represent the next step in the evolution of microprocessors this book is intended as a technical tutorial and introduction for engineers computer scientists the book concentrates on reduced instruction set risc processors

this book aims to clarify how to build the computational infrastructure for multi access edge computing mec from the perspectives of applications system software architecture cad and devices mec enables the execution of processing tasks that are challenging for iot devices without having to rely on the cloud by equipping 5g 6g base stations with computational resources following the introduction chapter 2 describes the multi fpga system that was developed for this project with various techniques to build fpga clusters chapter 3 discusses the middleware for mec and applications such as social implementation in nursing care facilities chapter 4 focuses on the roles of mec such as anonymization data collection and selection and describes the technologies for utilizing mec in the construction of smart cities chapter 5 discusses the realization of robot audition one of the most promising applications expected to run on mec it introduces an attempt to implement hark a widely used platform on mec chapter 6 presents a new fpga device slmlet which is more cost effective and power efficient than conventional fpgas and features communication links for multi node systems it is an ambitious chip equipped with variable structure ip differing from traditional fpgas the readers will gain an understanding of mec and related topics as well as insight into its future potential this knowledge is essential for engineers involved in cloud and edge computing as well as those interested in fpga and cad technologies

abstract this work examines the interaction of compiler scheduling techniques with processor features such as the instruction issue policy scheduling techniques designed to exploit instruction level parallelism are employed to schedule instructions for a set of multi issue architectures a compiler is developed which supports block scheduling loop unrolling

and software pipelining for a range of target architectures the compiler supports aggressive loop optimizations such as induction variable detection and strength reduction and code hoisting a set of machine configurations based on the mips r3000 isa are simulated allowing the performance of the combined compiler processor to be studied the aurora iii a prototype superscalar processor is used as a case study for the interaction of compiler scheduling techniques with processor architecture our results show that the scheduling technique chosen for the compiler has a significant impact on the overall system performance and can even change the rank ordering when comparing the performance of vliw dae and superscalar architectures our results further show that while significant the performance effects of the instruction issue policy may not be as large as the effects of other processor features which may be less costly to implement such as 64 bit wide data paths or store buffers
