graphs drawn on two dimensional surfaces have always attracted researchers by their beauty and by the variety of difficult questions to which they give rise the theory of such embedded graphs which long seemed rather isolated has witnessed the appearance of entirely unexpected new applications in recent decades ranging from galois theory to quantum gravity models and has become a kind of a focus of a vast field of research the book provides an accessible introduction to this new domain including such topics as coverings of riemann surfaces the galois group action on embedded graphs grothendieck s theory of dessins d enfants the matrix integral method moduli spaces of curves the topology of meromorphic functions and combinatorial aspects of vassiliev s knot invariants and in an appendix by don zagier the use of finite group representation theory the presentation is concrete throughout with numerous figures examples including computer calculations and exercises and should appeal to both graduate students and researchers

fixed point theory and graph theory provides an intersection between the theories of fixed point theorems that give the conditions under which maps single or multivalued have solutions and graph theory which uses mathematical structures to

illustrate the relationship between ordered pairs of objects in terms of their vertices and directed edges this edited reference work is perhaps the first to provide a link between the two theories describing not only their foundational aspects but also the most recent advances and the fascinating intersection of the domains the authors provide solution methods for fixed points in different settings with two chapters devoted to the solutions method for critically important non linear problems in engineering namely variational inequalities fixed point split feasibility and hierarchical variational inequality problems the last two chapters are devoted to integrating fixed point theory in spaces with the graph and the use of retractions in the fixed point theory for ordered sets introduces both metric fixed point and graph theory in terms of their disparate foundations and common application environments provides a unique integration of otherwise disparate domains that aids both students seeking to understand either area and researchers interested in establishing an integrated research approach emphasizes solution methods for fixed points in non linear problems such as variational inequalities split feasibility and hierarchical variational inequality problems that is particularly appropriate for engineering and core science applications

explores graphs derived from statistics and all families of functions sharpens critical thinking and analytical skills includes fully explained examples and numerous practice problems using each type of graph

the essential characteristic of a dynamic graphical method is the direct manipulation of elements of a graph on a computer screen which in high performance implementations the elements change virtually instantaneously on the screen this book contains a collection of papers about dynamic graphics dating from the late 1960s to 1988 although technology has advanced considerably the fundamental ideas about basic graphical principles and data analytic goals are still relevant today

a succinct and highly readable guide to creating effective graphs the right graph can be a powerful tool for communicating information improving a presentation or conveying your point in print if your professional endeavors call for you to present data graphically here is a book that can help you do it more effectively creating more effective graphs gives you the basic knowledge and techniques required to choose and create appropriate graphs for a broad range of applications using real world examples everyone can relate to the author draws on her years of experience in graphical data analysis and presentation to highlight some of today's most effective methods in clear concise language the author answers such common questions as what constitutes an effective graph for communicating data how do i choose the type of graph that is best for my data how do i recognize a misleading graph why do some graphs have logarithmic scales in no time you'll graduate from bar graphs and pie charts to graphs that illuminate data like dot plots box plots scatterplots linked micromaps trellis displays mosaic plots month plots scatterplot matrices most of them requiring only inexpensive easily downloadable software whether you're a novice at graphing or already use graphs in your work but want to improve them creating more effective graphs will help you develop the kind of clear accurate and well designed graphs that will allow your data to be understood
