we wrote this book to inspire the next generation of conservation biologists to help humans become better stewards of the world's biodiversity in doing so our desire was to fill two key gaps in the education of most conservation biologists that are beginning their studies this first gap is interdisciplinary training most textbooks of conservation and most university courses in conservation focus on the discipline's historical roots in the natural sciences e g botany ecology and disciplines of natural resource management e g forestry fisheries wildlife management but conservation is no longer a group of ecologists wildlife biologists or fisheries scientists trying to save their favorite species in a dwindling habitat the modern practice of conservation relies on numerous disciplines from the social sciences that account for human behaviors values needs and decision making modern conservation relies on disciplines from engineering and architecture to help plan design and construct practical solutions to problems and finally modern conservation relies on disciplines from the humanities that compose law and policy and that communicate effectively through literature art and photography numerous examples and exercises from these fields have been woven into this textbook to help improve interdisciplinary training the second gap we see in the education of conservation professionals is skills based training over the past few decades many universities have eliminated course requirements in biology chemistry physics and math as demand for bachelor of science degrees has waned and demand for bachelor of arts programs has increased e g bas in environmental sciences earth science conservation ecology etc many textbooks have been written to support ba programs that focus on giving students broad introductions to fields like conservation biology but few texts develop the depth of methods tools and techniques that students will need to be successful practitioners in the field we have carefully chosen the most important quantitative concepts methods tools techniques and models that students need for a career in conservation and we explain those in simple terms while also providing the practice needed to master these new skills given our focus on more interdisciplinary skills based training this book is written for aspiring conservation biologists who need more advanced training than is typically offered in an introductory level class conservation biology 2e supports courses for upper division undergraduates who have already had some introduction to environmental science ecology wildlife biology forestry or other fields related to conservation this book can also be used for entry level graduate courses such as those in the growing number of professional master's programs that provide advanced degrees in environmental science policy management or sustainability

john harper nature conservation has changed from an idealistic philosophy to a serious technology ecology the science that underpins the technology of conservation is still too immature to provide all the wisdom that it must it is arguable that the desire to conserve nature will in itself force the discipline of ecology to identify fundamental problems in its scientific goals and methods in return ecologists may be

able to offer some insights that make conservation more practicable harper 1987 the idea that nature species or communities is worth preserving rests on several fundamental arguments particularly the argument of nostalgia and the argument of human benefit and need nostalgia of course is a powerful emotion with some notable exceptions there is usually a feeling of dismay at a change in the status quo whether it be the loss of a place in the country for walking or rambling the loss of a painting or architectural monument or that one will never again have the chance to see a particular species of bird or plant

from its inception the u s department of the interior has been charged with a conflicting mission one set of statutes demands that the department must develop america s lands that it get our trees water oil and minerals out into the marketplace yet an opposing set of laws orders us to conserve these same resources to preserve them for the long term and to consider the noncommodity values of our public

landscape that dichotomy between rapid exploitation and long term protection demands what i see as the most significant policy departure of my tenure in office the use of science interdisciplinary science as the primary basis for land management decisions for more than a century that has not been the case instead we have managed this dichotomy by compartmentalizing the american landscape congress and my predecessors handled resource conflicts by drawing enclosures we ll create a national park here they said and we ll put a wildlife refuge over there simple enough as far as protection goes and outside those protected areas the message was equally simplistic y all come and get it have at it the nature and the pace of the resource extraction was not at issue if you could find it it was yours
