written for science majors who have completed a general chemistry course principles of environmental chemistry third edition enables students to understand the underlying chemical processes that are operating in the environment while demonstrating how difficult it is to measure these systems it emphasizes that all living and nonliving parts of our environment are made up of chemicals and that all of the natural processes continuously occurring in the environment involve chemical reactions with this concept of interdependence students begin to see that without some understanding of chemistry it is impossible to fully understand environmental issues such as ozone depletion global warming air and water pollution and the hazards of radioactivity the third edition includes a new chapter on green chemistry as well as numerous updates throughout to address the changes in the field key features includes a new chapter on green chemistry a new key term glossary is now included at the end of the text new feature boxes assess students understanding of chapter material with analytical questions and problems includes additional chemical equations throughout the text a new electronic student study guide and solutions manual is available with the third edition instructor s resources include powerpoint lecture outlines answers to end of chapter problems and a testbank a student companion website includes chapter outlines interactive glossary flashcards and weblinks

today there is worldwide concern that many of our human activities are endangering perhaps permanently the quality of the environment we must act fast to address these growing problems the second edition of principles of environmental chemistry exposes readers to environmental issues from a perspective that appreciates that chemical reactions drive all natural processes and outlines the connection between those processes and human behavior written for students with knowledge of general chemistry this text provides the tools needed to understand the underlying chemical processes operating in the environment while demonstrating how challenging it is to measure these systems with this concept of interdependence students will begin to understand pressing environmental issues like ozone depletion global warming air and water pollution and the hazards of radioactivity

environmental chemistry concerns with the broad interpretation on what environmental chemistry is and discusses chemistry in relation to environmental topics the book is divided into seven parts part i discusses the origins of different elements and interstellar molecules the development of the earth and the chemical evolution of life part ii talks about energy and its theoretical treatment the origin development and problems related to fossil fuels and the developing energy sources including storage distribution and conservation part iii discusses the air the structure and properties of the atmosphere and air pollution in relation to different industries and transportation mineral resources and solid wastes are tackled in part iv and the principles and treatment of water are explained in part v part vi discusses the sustenance of life amino

acids and the control of toxins and part vii studies the relationship of science ethics and ecology the text is good for those in the field of chemistry and wish to understand the importance of their field to the environment and for environmentalists and ecologists who want to know the relationship of chemistry with their studies
