this volume examines the limitations of mathematical logic and proposes a new approach to logic intended to overcome them to this end the book compares mathematical logic with earlier views of logic both in the ancient and in the modern age including those of plato aristotle bacon descartes leibniz and kant from the comparison it is apparent that a basic limitation of mathematical logic is that it narrows down the scope of logic confining it to the study of deduction without providing tools for discovering anything new as a result mathematical logic has had little impact on scientific practice therefore this volume proposes a view of logic according to which logic is intended first of all to provide rules of discovery that is non deductive rules for finding hypotheses to solve problems this is

essential if logic is to play any relevant role in mathematics science and even philosophy to comply with this view of logic this volume formulates several rules of discovery such as induction analogy generalization specialization metaphor metonymy definition and diagrams a logic based on such rules is basically a logic of discovery and involves a new view of the relation of logic to evolution language reason method and knowledge particularly mathematical knowledge it also involves a new view of the relation of philosophy to knowledge this book puts forward such new views trying to open again many doors that the founding fathers of mathematical logic had closed historically trigger
