this book presents all aspects of situational awareness using acoustic signals it starts by presenting the science behind understanding and interpretation of sound signals the book then goes on to provide various signal processing techniques used in acoustics to find the direction of sound source localize gunfire track vehicles and detect people the necessary mathematical background and various classification and fusion techniques are presented the book contains majority of the things one would need to process acoustic signals for all aspects of situational awareness in one location the book also presents array theory which is pivotal in finding the direction of arrival of acoustic signals in addition the book presents techniques to fuse the information from multiple homogeneous heterogeneous sensors for better detection matlab code is provided for majority of the real application which is a valuable resource in not only understanding the theory but readers can also use the code as a spring board to develop their own application based software code

techniques and tools for solving acoustics problems this is the first book of its kind that describes the use of ansys finite element analysis fea software and matlab engineering programming software to solve acoustic problems it covers simple text book problems such as determining the natural frequencies of a duct to progressively more complex problems that can only be solved using fea software such as acoustic absorption and fluid structure interaction it also presents benchmark cases that can be used as starting points for analysis there are practical hints too for using ansys software the material describes how to solve numerous problems theoretically and how to obtain solutions from the theory using matlab engineering software as well as analyzing the same problem using ansys workbench and ansys mechanical apdl developed for the practicing engineer free downloads on mecheng adelaide edu au avc software including matlab source code ansys apdl models and ansys workbench models includes readers techniques and tips for new and experienced users of ansys software identifies bugs and deficiencies to help practitioners avoid making mistakes acoustic analyses using matlab and ansys can be used as a textbook for graduate students in acoustics vibration and related areas in engineering undergraduates in mechanical and electrical engineering and as an authoritative reference for industry professionals

this book treats the topic of extending the adaptive filtering theory in the context of massive multichannel systems by taking into account a priori knowledge of the underlying system or signal the starting point is exploiting the sparseness in acoustic

multichannel system in order to solve the non uniqueness problem with an efficient algorithm for adaptive filtering that does not require any modification of the loudspeaker signals the book discusses in detail the derivation of general sparse representations of acoustic mimo systems in signal or system dependent transform domains efficient adaptive filtering algorithms in the transform domains are presented and the relation between the signal and the system based sparse representations is emphasized furthermore the book presents a novel approach to spatially preprocess the loudspeaker signals in a full duplex communication system the idea of the preprocessing is to prevent the echoes from being captured by the microphone array in order to support the aec system the preprocessing stage is given as an exemplarily application of a novel unified framework for the synthesis of sound figures finally a multichannel system for the acoustic echo suppression is presented that can be used as a postprocessing stage for removing residual echoes as first of its kind it extracts the near end signal from the microphone signal with a distortionless constraint and without requiring a double talk detector
