nonlinear equations arise in essentially every branch of modern science engineering and mathematics however in only a very few special cases is it possible to obtain useful solutions to nonlinear equations via analytical calculations as a result many scientists resort to computational methods this book contains the proceedings of the joint ams siam summer seminar computational solution of nonlinear systems of equations held in july 1988 at colorado state university the aim of the book is to give a wide ranging survey of essentially all of the methods which comprise currently active areas of research in the computational solution of systems of nonlinear equations a number of entry level survey papers were solicited and a series of test problems has been collected in an appendix most of the articles are accessible to students who have had a course in numerical analysis

solution of equations and systems of equations second edition deals with the laguerre iteration interpolating polynomials method of steepest descent and the theory of divided differences the book reviews the formula for confluent divided differences newton s interpolation formula general interpolation problems and the triangular schemes for

computing divided differences the text explains the method of false position regula falsi and cites examples of computation using the regula falsi the book discusses iterations by monotonic iterating functions and analyzes the connection of the regula falsi with the theory of iteration the text also explains the idea of the newton raphson method and compares it with the regula falsi the book also cites asymptotic behavior of errors in the regula falsi iteration as well as the theorem on the error of the taylor approximation to the root the method of steepest descent or gradient method proposed by cauchy ensures global convergence in very general conditions this book is suitable for mathematicians students and professor of calculus and advanced mathematics

discusses systems of equations with a small number of variables

this second edition provides much needed updates to the original volume like the first edition it emphasizes the ideas behind the algorithms as well as their theoretical foundations and properties rather than focusing strictly on computational details at the same time this new version is now largely self contained and includes essential proofs additions have been made to almost every chapter including an introduction to the theory of inexact newton methods a basic theory of continuation methods in the setting of differentiable manifolds and an expanded discussion of minimization methods new information on parametrized equations and continuation incorporates research since the first edition
