all us fossil fueled power plants coming on line after 1977 must meet standards for the prevention of significant deterioration of air quality as set forth in the 1977 clean air act amendments an analysis of the short term 24 h or less air quality impact of stack disposed effluents from proposed power plants is presented closed form solutions to the gaussian plume equation are developed for worst case meteorology for 3 h and 24 h situations the modeling technique uses a universal relationship for stack height based on good engineering practice requirements and shows that the resulting ground level concentrations are virtually independent of power plant size within the meteorological constraints the important parameters then become terrain elevation and degree of pollution control the use of worst case meteorology obviates the need for a detailed meteorological data base it is necessary only to check that the worst case conditions are in fact reasonable for the location in question a site specific consideration
