the council on tall buildings and urban habitat has produced four technical guides to date since the series launched in late 2012 each of these guides is the product of a ctbuh working group committees formed specifically to address focused topical subjects in the industry the intention

of each guide is the same to provide working knowledge to the typical building owner or professional who wants a better understanding of available options for improving tall buildings and what affects their design the object of the series is to provide a tool kit for the creation of better performing tall buildings and to spread the understanding of the considerations that need to be made in designing tall this technical guide offers an extensive overview of the use of vertical vegetation in high rise buildings an indepth analysis of green walls definitions and typology including standards policies and incentives it features comprehensive case studies along with architectural theories of the public and private benefits of green walls the book delves into architect design considerations and limitations the effects of green walls on energy efficiencies and includes recommendations and future research

ninety walls of 10 different types of masonry construction were tested under various combinations of vertical and transverse load it is shown that the effect of vertical load and wall slenderness on transverse strength can be predicted by rational analysis the analysis is based on established theory which has been extended to account for the properties of masonry similar methods of rational analysis have been adopted for the design of steel structures and are presently being considered for reinforced concrete structures

outstanding advances have been achieved on earthquake geotechnical engineering and microzonation in the last decade mostly due to the increase in the recorded instrumental in situ data and large number of case studies conducted in analyzing the observed effects during the recent major earthquakes during the 15th international conference on soil mechanics and geotechnical engineering held in istanbul in august 2001 the technical committee of earthquake geotechnical engineering tc4 of the international society of soil mechanics and geotechnical engineering organised a regional seminar on geotechnical earthquake engineering and microzonation where an effort has been made to present the recent advances in the field by eminent scientists and researchers the book idea was first suggested by the participants of this seminar the purpose of this book as well as of the seminar was to present the broad spectrum of earthquake geotechnical engineering and seismic microzonation including strong ground motion site characterisation site effects liquefaction seismic microzonation solid waste landfills and foundation engineering the subject matter requires multidisciplinary input from different fields of engineering seismology soil dynamics geotechnical and structural engineering the chapters in this book are prepared by some of the distinguished lecturers who took part in the seminar supplemented with contributions of few distinguished experts in the field of earthquake geotechnical engineering the editor would like to express his gratitude to all authors for their interest and efforts in preparing their manuscripts without their enthusiasm and support it would not have been possible to complete this book
