managers second edition has been extensively rewritten to not only bring it up to date with the state of current practice but also to serve as a textbook for university courses in construction engineering and management the authors advanced the previous edition s practical hands on approach and added material on the future of construction equipment fleet management which they believe will require a new technology based skillset to maximize the cost effectiveness of construction equipment operations as such the book covers the latest construction equipment technologies features examines emergent technologies in the field including automated machine guidance systems intelligent compaction operations and equipment related civil integrated management tools provides information on how to reduce an equipment fleet s environmental impact decreasing greenhouse gas emissions through enhanced equipment management and optimization practices discusses estimating equipment ownership operating costs economic life and optimal replacement timing demonstrates how to maximize profit by determining the optimum equipment mix and estimating productivity illustrates the use of production based linear scheduling and stochastic simulations to maximize project cost and schedule certainty this new edition will serve as an essential textbook for students as well as a valuable reference for a wide range of professionals within the construction architecture and engineering industries

this report provides an assessment of technology used in manufacturing modular homes in the united states and that used in the german prefabricated wooden home industry it is the first step toward identifying the research needs in automation and manufacturing methods that will facilitate mass customization in the home manufacturing industry within the united states a relatively low level of technology was found in domestic modular home manufacturers raw material transportation was mostly manual manually operated saws sized raw materials cranes were used to move subassemblies and modules were pushed by hand or with a battery powered pusher german prefabricated home manufacturers

used closed panels to construct walls roofs and floors rather than modular construction three levels of automation were identified manual semi automated and fully automated manual production methods were similar to those found in the united states in semi automated factories automated machinery was used but an operator was required to manually load unload and start the machine the fully automated factories had equipment capable of machining and transferring panel components and placing and fastening components together such investment in automation is risky in the cyclic housing industry the modular factory has elevated homebuilding from a craft to mass production but flexibility is reduced and significant customization is difficult future research should examine the cost effectiveness of using high levels of automation software and equipment in the u s homebuilding industry and whether it can profitably provide the manufacturing flexibility for mass customization alternatively the use of lean manufacturing in modular home factories to realize the same benefits needs to be examined

this book makes a strong case for investigating accidents not just those cases which produce injuries the study of accidents instead of injuries does not downgrade the importance of preventing human injury rather it recognizes that many no injury accidents might have resulted in personal injury property damage or both if the causes of accidents whether or not they result in injury can be ferreted out if it can be determined what unsafe conditions or unsafe acts or any combination was responsible for the accident there is reason to believe that greater progress in preventing accidents and injuries is possible
