traditional means of data gathering are inadequate for present purposes in hydrology and water management thus hydrologists are urgently seeking new ways for supplementing their conventional data supplies satellite remote sensing is being explored increasingly as one possible answer to such data acquisition problems both

because of its perceived facility for providing greatly improved space and time coverage of key hydrological observation systems and because the technologies of data acquisition transmission and processing have become more advanced and more capable although the use of remote sensing especially from satellites is currently less well developed in these contexts than in support of many other earth resource and environmental sciences much successful hydrological research has already been based upon satellite data and in limited but important ways satellite data have already begun to be used in water monitoring and management operations

in this completely revised edition volume i covers three major items the new classification of meteorology personnel the revised core curricula in meteorology and job specialized competencies volume ii deals with the classification of hydrological personnel and curricula for their initial qualification and early specialization in hydrology within the broader context of integrated water resources management publisher s description

divided into three main sections this text presents the results derived from satellite studies of the ocean a variety of hydrology related areas including evapotranspiration and soil moisture and the concept of vegetation condition index in which the intensity of drought is assessed
