this authoritative collection introduces the reader to the state of the art in iris recognition technology topics and features with a foreword by the father of iris recognition professor john daugman of cambridge university presents work from an international selection of preeminent researchers reflecting the uses of iris recognition in many different social contexts provides viewpoints from researchers in government industry and academia highlighting how iris recognition is both a thriving industry and an active research area surveys previous developments in the field and covers topics ranging from the low level e g physics of iris image acquisition to the high level e g alternative non daugman approaches to iris matching introduces many active and open areas of research in iris recognition including cross wavelength matching and iris template aging this book is an essential resource for anyone wishing to improve their understanding of iris recognition technology

the definitive work on iris recognition technology this comprehensive handbook presents a broad overview of the state of the art in this exciting and rapidly evolving field revised and updated from the highly successful original this second edition has also been considerably expanded in scope and content featuring four completely new chapters features provides authoritative insights from an international selection of preeminent researchers from government industry and academia reviews issues covering the full spectrum of the iris recognition process from acquisition to encoding presents surveys of topical areas and discusses the frontiers of iris research including cross wavelength matching iris template aging and anti spoofing describes open source software for the iris recognition pipeline and datasets of iris images includes new content on liveness detection correcting off angle iris images subjects with eye conditions and implementing software systems for iris recognition

what is iris recognition iris recognition is an automated method of biometric identification that uses mathematical pattern recognition techniques on video images of one or both of the irises of an individual s eyes whose complex patterns are unique stable and can be seen from some distance the discriminating powers of all biometric technologies depend on the amount of entropy they are able to encode and use in matching iris recognition is exceptional in this regard enabling the avoidance of collisions even in cross comparisons across massive populations its major limitation is that image acquisition from distances greater than a meter or two or without cooperation can be very

difficult however the technology is in development and iris recognition can be accomplished from even up to 10 meters away or in a live camera feed how you will benefit i insights and validations about the following topics chapter 1 iris recognition chapter 2 retinal scan chapter 3 john daugman chapter 4 biometric points chapter 5 eye vein verification chapter 6 biometric device chapter 7 private biometrics chapter 8 aadhaar chapter 9 biometrics in schools chapter 10 aadhaar act ii answering the public top questions about iris recognition iii real world examples for the usage of iris recognition in many fields who this book is for professionals undergraduate and graduate students enthusiasts hobbyists and those who want to go beyond basic knowledge or information for any kind of iris recognition

in the present work many methods are combined to build a reliable and fast method for feature extraction in iris recognition system reliable techniques for iris image enhancement and circle detection are used these techniques can then be used to facilitate the further study of the statistics of iris also a program coding with matlab going through all the stages of the iris recognition is built it is helpful to understand the procedures of iris recognition and demonstrate the key issues of iris recognition the hamming distance has been employed for classification of iris templates and two templates have been found to match if a test of statistical independence failed the system performed with perfect recognition and resulted in false accepts and false reject rates of 0 01 and 0 61 respectively the accuracy of the system is found to be 99 38 therefore iris recognition is reliable and accurate biometric technology

biometrics is a rapidly evolving field with applications ranging from accessing one s computer to gaining entry into a country the deployment of large scale biometric systems in both commercial and government applications has increased public awareness of this technology recent years have seen significant growth in biometric research resulting in the development of innovative sensors new algorithms enhanced test methodologies and novel applications this book addresses this void by inviting some of the prominent researchers in biometrics to contribute chapters describing the fundamentals as well as the latest innovations in their respective areas of expertise

this dissertation focuses on iris biometrics although the iris is the most accurate biometric its adoption has been relatively slow conventional iris recognition systems utilize still eye images captured in ideal environments and require highly constrained subject presentation a drop in recognition performance is observed when these constraints are removed as the quality of the data acquired is affected by heterogeneous factors for iris recognition to be widely adopted it can therefore be argued that the image capture must be facilitated and better performance should be achieved in less constrained imaging conditions the research work presented in this dissertation demonstrates how performance in iris recognition systems is improved by adopting a video based approach the following components have been investigated in this study and presented in relevant publications 1 robust eye extraction method of eye images in

face videos captured at a distance and on the move 2 selection of optimal frames in iris videos 3 iris segmentation in less constrained environments 4 an automated method for predicting inaccurate iris segmentation 5 optimization of iris codes for improved recognition the main results and novelties of this work include firstly the development of a fast and accurate method for detecting eye images in face videos secondly this work demonstrates that selection of optimal frames in nir iris videos lead to better recognition performance thirdly an accurate and robust iris segmentation model for eye images captured in uncontrolled conditions is proposed fourthly this research presents a fully automated segmentation evaluation model for detection of in correctly segmented iris images finally a new method for optimization of several iris codes into a single highly optimized iris code is introduced our results and experiments suggest that incorporation of the above methods in traditional iris recognition systems will be useful for the adoption of this technology by a larger community
