specialist periodical reports provide systematic and detailed review coverage of progress in the major areas of chemical research written by experts in their specialist fields the series creates a unique service for the active research chemist supplying regular critical in depth accounts of progress in particular areas of chemistry for over 80 years the royal society of chemistry and its predecessor the chemical society have been publishing reports charting developments in chemistry which originally took the form of annual reports however by 1967 the whole spectrum of chemistry could no longer be contained within one volume and the series specialist periodical reports was born the annual reports themselves still existed but were divided into two and subsequently three volumes covering inorganic organic and physical chemistry for more general coverage of the highlights in chemistry they remain a must since that time the spr series has altered according to the fluctuating degree of activity in various fields of chemistry some titles have remained unchanged while others have altered their emphasis along with their titles some have been combined under a new name whereas others have had to be discontinued

statistical mechanics is concerned with defining the thermodynamic properties of a macroscopic sample in terms of the properties of the microscopic systems of which it is composed the previous book introduction to statistical mechanics provided a clear logical and self contained treatment of equilibrium statistical mechanics starting from boltzmann s two statistical assumptions and presented a wide variety of applications to diverse physical assemblies an appendix provided an introduction to non equilibrium statistical mechanics through the boltzmann equation and its extensions the coverage in that book was enhanced and extended through the inclusion of many accessible problems the current book provides solutions to those problems these texts assume only introductory courses in classical and quantum mechanics as well as familiarity with multi variable calculus and the essentials of complex analysis some knowledge of thermodynamics is also assumed although the analysis starts with an

appropriate review of that topic the targeted audience is first year graduate students and advanced undergraduates in physics chemistry and the related physical sciences the goal of these texts is to help the reader obtain a clear working knowledge of the very useful and powerful methods of equilibrium statistical mechanics and to enhance the understanding and appreciation of the more advanced texts

the aim of this book is to develop the concepts and relations pertinent to the solution of many thermodynamic problems encountered in multi phase multi component systems in doing so it emphasizes a comprehension and development of general expressions for solving such problems rather than ready made equations for particular applications throughout the book the methods of gibbs are used with emphasis on the chemical potential
