the art and the science of building systems design evolve continuously as designers practitioners and researchers all endeavor to improve the performance of buildings and the comfort and productivity of their occupants retaining coverage from the original second edition while updating the information in electronic form heating and cooling of buildings design for efficiency revised second edition presents the technical basis for designing the lighting and mechanical systems of buildings along with numerous homework problems the revised second edition offers a full chapter on economic analysis and optimization new heating and cooling load procedures and databases and simplified procedures for ground coupled heat transfer calculations the accompanying cd rom contains an updated version of the heating and cooling of buildings hcb software program as well as electronic appendices that include over 1 000 tables in html format that can be searched by major categories a table list or an index of topics ancillary information is available on the book s website hcbcentral com from materials to computers this edition explores the latest technologies exerting a profound effect on the design and operation of buildings emphasizing design optimization and critical thinking the book continues to be the ultimate resource for understanding energy use in buildings

energy use in buildings in the eu represents about 40 of the total annual energy consumption with greater awareness of the need to reduce energy consumption comes a growth of interest in passive cooling particularly as an alternative to air

conditioning this book describes the fundamentals of passive cooling together with the principles and formulae necessary for its successful implementation the material is comprised largely of information and results compiled under the save european research programme

heating and cooling of buildings second edition by kreider and rable covers technologies from materials to computers that are exerting a profound effect on the design and operation of buildings numerous examples are presented and solved to reinforce important concepts and software applications are integrated throughout the contents of this edition have been expanded to include a chapter on economic analysis and optimization new heating and cooling load procedures more than 200 new homework problems and new and simplified procedures for ground coupling heat transfer calculations one of the most notable difference in the second edition of this book is that many of the appendices from the first edition of this book have been moved to the accompanying cd rom the cd rom amounts to a searchable database of tables charts and information on building codes for example there are more than 1 000 tables in the electronic appendices that can be searched by major categories a table list or an index of topics the cd also directs students to the central web site where several hundred links are maintained to hep students find manufacturer and government data browse in newsgroups and find any corrections and updates to t e text and date tables students have come to expect this kind interaction through internet searches

heating and cooling of buildings principles and practice of energy efficient design third edition is structured to provide a rigorous and comprehensive technical foundation and coverage to all the various elements inherent in the design of energy efficient and green buildings along with numerous new and revised examples design case studies and homework problems the third edition includes the hcb software along with its extensive website material which contains a wealth of data to support design analysis and planning based around current codes and standards the third edition explores the latest technologies that are central to design and operation of today s buildings it serves as an up to date technical resource for future designers

practitioners and researchers wishing to acquire a firm scientific foundation for improving the design and performance of buildings and the comfort of their occupants for engineering and architecture students in undergraduate graduate classes this comprehensive textbook

a practical sourcebook for building designers providing comprehensive discussion of the impact of basic architectural choices on cooling efficiency including the layout and orientation of the structure window size and shading exterior color and even the use of plantings around the site all major varieties of passive cooling systems are presented with extensive analysis of performance in different types of buildings and in different climates ventilation radiant cooling evaporative cooling soil cooling and cooling of outdoor spaces

overheating in buildings is commonplace this book describes how we can keep cool without conventional air conditioning improving comfort and productivity while reducing energy costs and carbon emissions it provides architects engineers and policy makers with a how to guide to the application of natural cooling in new and existing buildings it demonstrates through reference to numerous examples that natural cooling is viable in most climates around the world this completely revised and expanded second edition includes an overview of natural cooling past and present guidance on the principles and strategies that can be adopted a review of the applicability of different strategies explanation of simplified tools for performance assessment a review of components and controls a detailed evaluation of case studies from the usa europe india and china this book is not just for the technical specialist as it also provides a general grounding in how to avoid or minimise air conditioning importantly it demonstrates that understanding our environment rather than fighting it will help us to live sustainably in our rapidly warming world

in modern extensively glazed office buildings air conditioning is increasingly applied even in moderate and cold climates night time ventilation is often seen as a promising passive cooling concept however due to uncertainties in the prediction of thermal comfort architects and engineers are still hesitant to apply passive cooling

techniques the concept involves cooling the building structure overnight in order to provide a heat sink during the occupancy period as this requires a sufficiently high temperature difference between the ambient air and the building structure the efficiency of night cooling is highly sensitive to climatic conditions and hence also to climate warming because heat gains and night ventilation periods typically do not coincide in time heat storage is essential for effective night cooling the results of parametric simulation studies and experimental investigations show a significant impact of the heat transfer at internal room surfaces on heat storage capacity especially for thick thermally heavy elements a practicable method for the estimation of the potential for cooling by night time ventilation during an early stage of design is proposed

for use on hvac heating ventilation air conditioning courses offered in mechanical and some civil engineering departments the book emphasizes the building envelope aspect of heating and cooling systems as opposed to the mechanical equipment involved and focuses on design optimization

this timely study deals with the heating and cooling of buildings using innovative systems that can reduce fossil fuel and electric energy requirements by as much as 80 percent emphasis is placed on thermal storage utility rate structures peak load problems and cogeneration of heat and power in small scale applications the first several chapters treat promises and problems of solar energy use for efficient comfort conditioning other contributions deal with the social implications of future energy efficiency requirements with a focus on the community

in the first book of its kind this volume addresses the problem of the future cooling energy demand the global frame defining the actual and future cooling energy consumption in the building sector based on the explored inputs and forecasts a model was developed to predict the future cooling energy consumption of both the residential and commercial sector low energy high performance technological solutions for cooling energy problem in the building and city level will be presented

the way we heat cool and ventilate our buildings is central to many of today's

concerns including providing comfortable healthy and productive environments using energy and materials efficiently and reducing greenhouse gas emissions as we drive towards a zero carbon society design solutions that combine architecture engineering and the needs of the individual are increasingly being sought thermal design of buildings aims to provide an understanding from which such solutions can be developed placing technological developments within the context of a wider world view of the built environment and energy systems and an historical perspective of how buildings have responded to climate and sustainable development

in the present scenario the use of passive concepts for heating and cooling the buildings has emerged as an important parameter to look upon this model explains the effect of occupancy activities in which the occupants are involved environmental conditions and the building materials on the comfort level and various methods to minimize the energy involved to achieve the conditions for comfort as seen the major factor that influences the cooling load of the building is the envelope and the ventilation system used in this paper more emphasis has been given on the cooling load and heat transfer rather than any other parameter here it is interesting to note that the norms or specification in the form of various codes given by the ecbc energy conservation building code are not equally applicable for climatic conditions of all the regions that is it is not applicable for different parts of the world

this book supports hvac planners in reducing the cooling energy demand improving the indoor environment and designing more cost effective building concepts high performance buildings have shown that it is possible to go clearly beyond the energy requirements of existing legislation and obtaining good thermal comfort however there is still a strong uncertainty in day to day practice due to the lack of legislative regulations for mixed mode buildings which are neither only naturally ventilated nor fully air conditioned but use a mix of different low energy cooling techniques based on the findings from monitoring campaigns long term measurements in combination with field studies on thermal comfort simulation studies and a comprehensive review on existing standards and guidelines this book acts as a commonly accessible knowledge pool for passive and low energy cooling techniques
