this book presents the achievements of the author s team in the research of a special
underactuated system called mobile wheeled inverted pendulum mwip developed
over recent years it focuses on a combination of theory and practice and almost all
algorithms are verified on the real mwip system taking the dynamic modeling control
and simulation as the mainline this book first introduces the particularity control
challenges and applications of the mwip system then lagrange function is adopted to
model the dynamics of two dimensional and three dimensional mwip systems then
based on the special characteristics of the mwip s dynamics a new high order
disturbance observer is designed and a control strategy is proposed by combining
the high order disturbance observer with a novel design of sliding mode manifold
furthermore several methods to overcome the chattering problem of the traditional
sliding mode control are presented in detail besides some intelligent algorithms
related to the interval type 2 fuzzy logic control are applied to the mwip system
finally the future development of underactuated robot has been prospected this book
is intended for researchers and engineers in robotics and control it can also be used
as supplementary reading for nonlinear systems theory at the graduate level the in
depth theory and detailed platform construction provide an excellent convenience for
readers to build their platforms and learn the knowledge they need
