myc is a pleiotropic transcription factor fundamental for many cellular processes it is an infamous and highly studied oncogene with around 10 000 articles published in the last decade the majority of these link it to cancer the focus on myc as a hot target in cancer has led to immense efforts from academia through to pharmaceutical companies being directed towards finding a myc inhibitor not surprisingly given its fundamental nature in many physiological processes myc has also been linked to a large variety of pathologies other than cancer the growing efforts to develop myc inhibitors as cancer therapies will have important implications for the treatment of these diseases too whether they have a clearly demonstrated aetiology linked with myc or so far are only at early stages of association with it interestingly the activation of myc may also prove helpful in the field of regenerative medicine and reversal of ageing the aim of this research topic is therefore to describe non oncological pathologies and conditions to which myc modulation could be applied these will include conditions that have strong links to myc and where myc modulation has already been modelled as well as conditions that so far have more limited data linking them to myc but where it seems to have a key role authors will be expected to briefly review the particular disease and what is known to link myc to it plus the possibility of any clinical trials in the near future
