this paper examines the distribution of output around capacity when money demand is a nonlinear function of the nominal interest rate such that nominal interest rates cannot become negative when fluctuations in output result primarily from disturbances to the money market the variance of output is shown to be an increasing function of the trend inflation rate when they result from disturbances to the goods market the variance of output is a decreasing function of the trend inflation rate when both disturbances are significant there exists in general a critical non zero trend inflation rate that minimizes the variance of output

this thesis describes a method to control rare events in non equilibrium systems by applying physical forces to those systems but without relying on numerical simulation techniques such as copying rare events in order to study this method the book draws on the mathematical structure of equilibrium statistical mechanics which connects large deviation functions with experimentally measureable thermodynamic functions referring to this specific structure as the phenomenological structure for the large deviation principle the author subsequently extends it to time series statistics that can be used to describe non equilibrium physics the book features pedagogical explanations and also shows many open problems to which the proposed method can be applied only to a limited extent beyond highlighting these challenging problems as a point of departure it especially offers an effective means of description for rare events which could become the next paradigm of non equilibrium statistical mechanics
