It incorporates the World Bank's IFC performance standards and best practice examples from developing as well as developed countries. It includes new chapters on emerging ESIA topics such as climate change, ecosystem services, cultural impacts, resource efficiency, land acquisition and involuntary resettlement. Invaluable to undergraduate and MSc students of ESIA on planning, ecology, geography and environment courses, this internationally oriented fourth edition of *Methods of Environmental and Social Impact Assessment* is also of great use to planners, ESIA practitioners and professionals seeking to update their skills.

Flash floods typically develop in a period of a few hours or less and can arise from heavy rainfall and other causes such as dam or flood defence breaches and ice jam breaks. The rapid development often associated with a high debris content can present a considerable risk to people and property. This book describes recent developments in techniques for monitoring and forecasting the development of flash floods and providing flood warnings. Topics which are discussed include rainfall and river monitoring, nowcasting, numerical weather prediction, rainfall runoff modelling and approaches to the dissemination of flood warnings and provision of an emergency response. The book is potentially useful on civil engineering, water resources, meteorology and hydrology courses and for postgraduate studies but is primarily intended as a review of the topic for a wider audience.

This book provides important new and actionable tools for diverse cities and communities facing climate disasters to engage in risk assessment and green recovery. The on-the-ground perspective from case studies across the global south ensures a culturally inclusive perspective too often missing from the current dialogue. This book offers integrated, actionable and culturally inclusive risk management and green recovery conceptual frameworks and methodologies based on case studies from communities across the global south. Through its focus on flood disasters, this book provides an integrated approach to climate adaptation, green growth and mitigation that can unlock climate action and increase community resilience across the global south. This book is intended for university students, professionals, local governments and policy decision makers.

water plays an essential role in the development and functioning of a city but could also be a key risk factor for urban pluvial flooding which may occur more frequently in the context of future climate change the traditional means of flood risk management relied heavily on engineering measures or the use of gray infrastructure recently there has been a call to integrate nature based solutions nbs which make use of natural processes and ecosystem services with conventional engineering approaches nbs infrastructures and designs pay great attention to ecosystem services considerations in assessing their induced hydrological processes as well as in managing the stormwater and mitigating urban flood and droughts nevertheless compared with grey infrastructure larger space could be demanded for nbs while the buffer effect for nbs in extremes events is still uncertain for evaluation
