the hippocampus is one of a group of remarkable structures embedded within the brain's medial temporal lobe long known to be important for memory it has been a prime focus of neuroscience research for many years the hippocampus book promises to facilitate developments in the field in a major way by bringing together for the first time contributions by leading international scientists knowledgeable about hippocampal anatomy physiology and function this authoritative volume offers the most comprehensive up to date account of what the

hippocampus does how it does it and what happens when things go wrong at the same time it illustrates how research focusing on this single brain structure has revealed principles of wider generality for the whole brain in relation to anatomical connectivity synaptic plasticity cognition and behavior and computational algorithms well organized in its presentation of both theory and experimental data this peerless work vividly illustrates the astonishing progress that has been made in unraveling the workings of the brain the hippocampus book is destined to take a central place on every neuroscientist's bookshelf

1.1 contexts the principal issue with which this monograph deals is the role of the hippocampus in establishing and using representations of contexts for information processing however before this issue can be addressed directly it is necessary to ask what is meant by the word context the first answer which comes to mind is likely to be something along the following lines a context is a framework or background of information with respect to which more specific items of information can be identified and manipulated this answer may be correct but it begs a fundamental question why should it be necessary to subdivide information into specific items of information and the more global backgrounds or frameworks this question is especially pertinent if we are thinking of information representation in the brain since neuroscientists or at least the vast majority of them believe that the basic way in which patterns of information are encoded in the brain is as combinations of connections selected in a variety of ways since both items of information and contexts are just such patterns apparently differing only in size it is far from clear why there should be a categorical division between the two this question is relatively new in the neurosciences however in a somewhat different guise it has been alive for a long time since the publication of Immanuel Kant's critique of pure reason

this biography of educational activist and black studies pioneer Bertha Maxwell Roddey examines a life of remarkable achievements and leadership in the early years of the desegregated south Sonya Ramsey describes how Maxwell Roddey and her peers turned hard won civil rights and feminist milestones into tangible accomplishments in North Carolina and nationwide from the late 1960s to the 1990s

organized by wave features rather than pattern names this atlas helps guide the reader to an EEG interpretation even when the waveform is unfamiliar the first section takes the reader through the process of characterizing EEG waves by their features the second section organizes EEG patterns by their features so provides EEG waveform differential diagnoses the third section is organized alphabetically by pattern name with each pattern described in a way that allows the reader to distinguish it from similarly appearing patterns examples of the patterns also are provided
