this textbook provides essential information for students of inorganic chemistry or for chemists pursuing self study the presentation of topics is made with an effort to be clear and concise so that the book is portable and user friendly

inorganic chemistry 2e is divided into five major themes structure condensed phases solution chemistry main group and coordination compounds with several chapters in each there is a logical progression from atomic structure to molecular structure to properties of substances based on molecular structures to behavior of solids etc the author emphasizes fundamental principles including molecular structure acid base chemistry coordination chemistry ligand field theory and solid state chemistry and presents topics in a clear concise manner there is a reinforcement of basic principles throughout the book for example the hard soft interaction principle is used to explain hydrogen bond strengths strengths of acids and bases stability of coordination compounds etc the book contains a balance of topics in theoretical and descriptive chemistry new to this edition new and improved illustrations including symmetry and 3d molecular orbital representationsexpanded coverage of spectroscopy instrumental techniques organometallic and bio inorganic chemistrymore in text worked out examples to encourage active learning and to prepare students for their exams concise coverage maximizes student understanding and minimizes the inclusion of details students are unlikely to use discussion of elements begins with survey chapters focused on the main groups while later chapters cover the elements in greater detail each chapter opens with narrative introductions and includes figures tables and end of chapter problem sets

introduction to solid state chemistry provides a strong background to the structures of solids and factors that determine this structure the content presented will also stress transformations of solids both in physical forms and chemical composition in so doing topics such as phase transitions sintering reactions of coordination compounds photovoltaic compounds are described whilst kinetics and mechanisms of solid state reactions are covered in depth there are currently few books that deal with solid state chemistry where a considerable number instead deal with solid state physics and materials science engineering this book provides someone needing or wishing to learn about the chemistry of solids a comprehensive resource that describes structures of solids the behaviour of solids under applied stresses the types of reactions that solids undergo and the phenomenological aspects of reactions in solids kinetics of reactions in solids is very seldom covered in current literature and an understanding of the mechanisms of reactions in solids is necessary for many applications james e house provides a balanced treatment of structure dynamics and behaviour of solids at a level commensurate with upper level undergraduates or beginning graduate students who wish to obtain an introduction and overview to solid state chemistry provides a fundamental introduction and entry point to solid state chemistry acting as a useful prerequisite for further learning in the area presents a balanced approach that

not only emphasizes structures of solids but also provides information on reactions of solids and how they occur gives much needed focus to the kinetics of reactions of solids and their mechanisms where existing literature covers little of this explores crucial solid state chemistry topics such as solar energy conversion reactions of solid coordination compounds diffusion sintering and other transformations of solids features accessible and well written examples and case studies featuring many new and bespoke supporting illustrations offering an excellent framework that will help students to understand reaction mechanisms
