this is an introduction for social science students to the growing field of spatial data analysis using the r platform the text assumes no prior knowledge of either beyond the contents of an introductory statistics course it uses the open source software r and relevant spatial data analysis packages to provide practical guidance of how to conduct spatial data analysis with readers own data sets the book first briefly introduces students to r covers some basic concepts in statistical data analysis and then focuses on discussing the central ideas of spatial data analysis all the discussions are supported with r scripts so that students can work on their own and produce results that the book helps interpret each chapter ends with review questions to test understanding the book is suited for upper level undergraduate social science students and graduate students and other social scientists who are interested in analyzing their spatial data with r a companion website for the book at edge sagepub com yu includes r code and data for students to replicate the examples in the book the password protected instructor side of the site includes exercises and answers which can be set for homework

scientific research often starts with data collection however many researchers pay insufficient attention to this first step in their research the author researcher at wageningen university and research often had to conclude that the data collected by fellow researchers were suboptimal or in some cases even unsuitable for their aim one reason is that sampling is frequently overlooked in statistics courses another reason is the lack of practical textbooks on sampling numerous books have been published on the statistical analysis and modelling of data using r but to date no book has been published in this series on how these data can best be collected this book fills this gap spatial sampling with r presents an overview of sampling designs for spatial sample survey and monitoring it shows how to implement the sampling designs and how to estimate sub population and space time parameters in r key features describes classical basic sampling designs for spatial survey as well as recently developed advanced sampling designs and estimators presents probability sampling designs for estimating parameters for a sub population as well as non probability sampling designs for mapping gives comprehensive overview of model assisted estimators covers bayesian

approach to sampling design illustrates sampling designs with surveys of soil organic carbon above ground biomass air temperature opium poppy explains integration of wall to wall data sets e g remote sensing images and sample data data and r code available on github exercises added making the book suitable as a textbook for students the target group of this book are researchers and practitioners of sample surveys as well as students in environmental ecological agricultural science or any other science in which knowledge about a population of interest is collected through spatial sampling this book helps to implement proper sampling designs tailored to their problems at hand so that valuable data are collected that can be used to answer the research questions
