in this volume the authors present some new trends in real algebraic geometry based on the study of arc spaces and additive invariants of real algebraic sets generally real algebraic geometry uses methods of its own that usually differ sharply from the more widely known methods of complex algebraic geometry this feature is particularly apparent when studying the basic topological and geometric properties of real algebraic sets the rich algebraic structures are usually hidden and cannot be recovered from the topology the use of arc spaces and additive invariants partially obviates this disadvantage moreover these methods are often parallel to the basic approaches of complex algebraic geometry the authors presentation contains the construction of local topological invariants of real algebraic sets by means of algebraically constructible functions this technique is extended to the wider family of arc symmetric semialgebraic sets moreover the latter family defines a natural topology that fills a gap between the zariski topology and the euclidean topology in real equisingularity theory kuo s blow analytic equivalence of real analytic function germs provides an equivalence relation that corresponds to topological equivalence in the complex analytic set up among other applications arc symmetric geometry via the motivic integration approach gives new invariants of this equivalence allowing some initial classification results the volume contains two courses and two survey articles that are designed for a wide audience in particular students and young researchers

this book brings together recent research work on algebraic specification as which aims to provide formal techniques for the specification and prototyping of software

this book contains articles contributed by eminent mathematicians projecting the current trends in functional analysis the book will be very useful to researchers working or intend to work in areas of functional analysis
