on the occasion of the 150th anniversary of Sophus Lie an international workshop on modern group analysis advanced analytical and computational methods in mathematical physics has been organized in Acireale Catania Sicily October 27-31 1992. The workshop was aimed to enlighten the present state of this rapidly expanding branch of applied mathematics. Main topics of the conference were classical Lie groups applied for constructing invariant solutions and conservation laws, conditional partial symmetries, Backlund transformations, approximate symmetries, group analysis of finite difference equations, problems of group classification, software packages in group analysis. The success of the workshop was due to the participation of many experts in group analysis from different countries. This book consists of selected papers presented at the workshop. We would like to thank the scientific committee for the generous support of recommending invited lectures and selecting the papers for this volume as well as the members of the organizing committee for their help. The workshop was made possible by the financial support of several sponsors that are listed below. It is also a pleasure to thank our colleague Enrico Gregorio for his invaluable help of this volume.

In the last 20 years the study of operator algebras has developed from a branch of functional analysis to a central field of mathematics with applications and connections with different areas in both pure mathematics: foliations, index theory, K-theory, cyclic homology, affine Kac-Moody algebras, quantum groups, low-dimensional topology and mathematical physics. Integrable theories, statistical mechanics, conformal field theories and the string theories of elementary particles. The theory of operator algebras was initiated by von Neumann and Murray as a tool for studying group representations and as a framework for quantum mechanics and has since kept in touch with its roots in physics as a framework for quantum statistical mechanics and the formalism of algebraic quantum field theory. However, in 1981 the study of operator algebras took a new turn with the introduction by Vaughan Jones of subfactor theory and remarkable connections were found with knot theory, 3-manifolds, quantum groups and integrable systems in statistical mechanics and conformal field theory. The purpose of this book, one of the first in the area, is to look at these combinatorial algebraic developments from the perspective of operator algebras to bring the reader to the frontline of research with the minimum of prerequisites from classical theory.
