in the last 20 years the study of operator algebras has developed from a branch of functional analysis to a central field of

mathematics with applications and connections with different areas in both pure mathematics foliations index theory k theory cyclic homology affine kac moody algebras quantum groups low dimensional topology and mathematical physics integrable theories statistical mechanics conformal field theories and the string theories of elementary particles the theory of operator algebras was initiated by von neumann and murray as a tool for studying group representations and as a framework for quantum mechanics and has since kept in touch with its roots in physics as a framework for quantum statistical mechanics and the formalism of algebraic quantum field theory however in 1981 the study of operator algebras took a new turn with the introduction by vaughan jones of subfactor theory and remarkable connections were found with knot theory 3 manifolds quantum groups and systems in statistical mechanics and conformal field theory the purpose of this book one of the first in the area is to look at these combinatorial algebraic developments from the perspective of operator algebras to bring the reader to the frontline of research with the minimum of prerequisites from classical theory
