this book provides engineers and scientists with a single source introduction to the concepts models and case studies for making credible reliability assessments it satisfies the need for thorough discussions of several fundamental subjects section i contains a comprehensive overview of assessing and assuring reliability that is followed by discussions of concept of randomness and its relationship to chaos uses and limitations of the binomial and poisson distributions relationship of the chi square method and poisson curves derivations and applications of the exponential weibull and lognormal models examination of the human mortality bathtub curve as a template for components section ii introduces the case study modeling of failure data and is followed by

analyses of 5 sets of ideal weibull lognormal and normal failure data 83 sets of actual real failure data the intent of the modeling was to find the best descriptions of the failures using statistical life models principally the weibull lognormal and normal models for characterizing the failure probability distributions of the times cycles and miles to failure during laboratory or field testing the statistical model providing the preferred characterization was determined empirically by choosing the two parameter model that gave the best straight line fit in the failure probability plots using a combination of visual inspection and three statistical goodness of fit gof tests this book offers practical insight in dealing with single item reliability and illustrates the use of reliability methods to solve industry problems
