this tutorial contains written versions of seven lectures on computational combinatorial optimization given by leading members of the optimization community the lectures introduce modern combinatorial optimization techniques with an emphasis on branch and cut algorithms and lagrangian relaxation approaches polyhedral combinatorics as the mathematical backbone of successful algorithms are covered from many perspectives in particular polyhedral projection and lifting techniques and the importance of modeling are extensively discussed applications to prominent combinatorial optimization problems e g in production and transport planning are treated in many places in particular the book contains a state of the art account of the most successful techniques for solving the traveling salesman problem to optimality

this book presents a structured approach to formulate model and solve mathematical optimization problems for a wide range of real world situations among the problems covered are production distribution and supply chain planning scheduling vehicle routing as well as cutting stock packing and nesting the optimization techniques used to solve the problems are primarily linear mixed integer linear nonlinear and mixed integer nonlinear programming the book also covers important considerations for solving real world optimization problems such as dealing with valid inequalities and symmetry during the modeling phase but also data interfacing and visualization of results in a more and more digitized world the broad range of ideas and approaches presented helps the reader to

learn how to model a variety of problems from process industry paper and metals industry the energy sector and logistics using mathematical optimization techniques

this book contains a selection of refereed papers presented at the international conference on operations research or 2013 which took place at erasmus university rotterdam september 3 6 2013 the conference was jointly organized by the german and the dutch or society more than 800 scientists and students from over 50 countries attended or 2013 and presented more than 600 papers in parallel topical streams as well as special award sessions the theme of the conference and its proceedings is impact on people business and society

this book is a collection of the latest developments models and applications within the transdisciplinary fields related to metaheuristic computing providing readers with insight into a wide range of topics such as genetic algorithms differential evolution and ant colony optimization provided by publisher

this synthesis will be of interest to highway administrators pavement management system pms maintenance and computer engineers and technologists involved with data collection and computer programming for the purposes of a pms this synthesis describes the state of the practice with respect to pavement management methodologies to select projects and recommend preservation treatments this report of the transportation research board also describes the predominant pavement management methodologies being used by u s state and canadian provincial transportation agencies provides a general description of each methodology and summarizes the requirements benefits hindrances and constraints associated with each it includes a review of domestic literature and a survey of current practices in north america in addition case studies are included to illustrate the use of these methodologies within transportation agencies operational and soon to be implemented technologies are also discussed and an extensive bibliography is provided for further reference

several important and efficient methods of solution of specific types of linear programming problems have the feature of sometimes providing optimal solutions which are not extreme

point or basic solutions so that important and useful analyses provided by knowledge of the optimal dual evaluators are not available it is also often desirable to be able to begin with a solution suggested by knowledgeable persons with experience in the field or other considerations and to proceed immediately to a basic solution at least as good as the suggested one in this paper it is shown how part of the technique of proof of the opposite sign theorem can be employed in a simple algorithm to achieve this end this method is equally valid when maximizing a nonlinear but convex objective function a tested algol code is provided for executing the algorithm in a manner compatible as a procedure with other programs author

linear optimization and duality a modern exposition departs from convention in significant ways standard linear programming textbooks present the material in the order in which it was discovered duality is treated as a difficult add on after coverage of formulation the simplex method and polyhedral theory students end up without knowing duality in their bones this text brings in duality in chapter 1 and carries duality all the way through the exposition chapter 1 gives a general definition of duality that shows the dual aspects of a matrix as a column of rows and a row of columns the proof of weak duality in chapter 2 is shown via the lagrangian which relies on matrix duality the first three lp formulation examples in chapter 3 are classic primal dual pairs including the diet problem and 2 person zero sum games for many engineering students optimization is their first immersion in rigorous mathematics conventional texts assume a level of mathematical sophistication they don't have this text embeds dozens of reading tips and hundreds of answered questions to guide such students features emphasis on duality throughout practical tips for modeling and computation coverage of computational complexity and data structures exercises and problems based on the learning theory concept of the zone of proximal development guidance for the mathematically unsophisticated reader about the author craig a tovey is a professor in the hilton stewart school of industrial and systems engineering at georgia institute of technology dr tovey received an ab from harvard college an ms in computer science and a phd in operations research from stanford university his principal activities are in operations research and its interdisciplinary applications he received a presidential young investigator award and the jacob wolfowitz prize for research in heuristics he was named
