if an automobile tire leaks or an electric light switch fails if we are short changed at a department store or erroneously billed for phone calls not made if a plane departure is delayed due to a mechanical failure these are rather ordinary annoyances which we have come to accept as normal occurrences contrast this with failure of a food product if foreign matter is found in a food if a product is discolored or crushed if illness or discomfort occurs when a food product is eaten the consumer reacts with anger fear and sometimes mass hysteria the offending product is often returned to the seller or a disgruntled letter is written to the manufacturer in an extreme case an expensive law suit may be filed against the company the reaction is almost as severe if the failure is a difficult to open package or a leaking container there is no tolerance for failure of food products dozens of books on quality written for hardware or service industries discuss failure rates product reliability serviceability maintainability warranty and repair manufacturers in the food industry cannot use these measurements food reliability must be 100 failure rate 0 serviceability maintainability warranty and repair are meaningless terms to food processors

this volume treats the four main categories of statistical quality control general sqc methodology on line control including sampling inspection and

statistical process control off line control with data analysis and experimental design and fields related to reliability experts with international reputation present their newest contributions

in the 1920 s walter shewhart visualized that the marriage of statistical methods and manufacturing processes would produce reliable and consistent quality products shewhart 1931 conceived the idea of statistical process control spc and developed the well known and appropriately named shewhart control chart however from the 1930s to the 1990s literature on spc schemes have been captured by the shewhart paradigm of normality independence and homogeneous variance when in fact the problems facing today s industries are more inconsistent than those faced by shewhart in the 1930s as a result of the advances in machine and sensor technology process data can often be collected on line in this situation the process observations that result from data collection activities will frequently not be serially independent but autocorrelated autocorrelation has a significant impact on a control chart the process may not exhibit a state of statistical control when in fact it is in control as the prevalence of this type of data is expected to increase in industry hahn 1989 so does the need to control and monitor it equivalently literature has reflected this trend and research in the area of spc with autocorrelated data continues so that effective methods of handling correlated data are available this type of data regularly occurs in the chemical and process industries and is pervasive in computer integrated manufacturing environments clinical laboratory settings and in the majority of spc applications across various manufacturing and service industries alwan 1991
