section headings in this handbook include forecasting methodology forecasting models forecasting with different data structures and applications of forecasting methods

in recent years nonlinearities have gained increasing importance in economic and econometric research particularly after the financial crisis and the economic downturn after 2007 this book contains theoretical computational and empirical papers that incorporate nonlinearities in econometric models and apply them to real economic problems it intends to serve as an inspiration for researchers to take potential nonlinearities in account researchers should be aware of applying linear model types spuriously to problems which include non linear features it is indispensable to use the correct model type in order to avoid biased recommendations for economic policy

the 30th volume of advances in econometrics is in honor of the two individuals whose hard work has helped ensure thirty successful years of the series thomas fomby and r carter hill

this volume is dedicated to the memory and the achievements of professor sir clive granger economics nobel laureate and one of the great econometricians and applied economists of the twentieth and early twenty first centuries it comprises contributions from leading econometricians and applied economists who knew sir clive and interacted with him over the years and who wished to pay tribute to him as both a great economist and econometrician and as a great man this book was originally published as a special issue of applied financial economics

in macrodynamics and business cycle analysis we find nowadays a variety of approaches elaborating frameworks for studying the fluctuations in economic and financial data these approaches are viewed from keynesian monetarist and rational expectations standpoints there are now also numerous empirical methods for the testing of nonlinear data generating mechanisms this volume brings together a selection of contributions on theories of the business cycle and new empirical methods and synthesizes the new results the volume i gives an overview of current models and modern concepts and tools for analyzing the business cycle ii demonstrates where possible the relation of those models to the history of business cycle analysis and iii presents current work surveys and original work on new empirical methods of studying cycle generating mechanisms

the journal of econometrics is designed to serve as an outlet for important new research in both theoretical and applied econometrics the scope of the journal includes papers dealing with estimation and other methodological aspects of the application of statistical inference to economic data as well as papers dealing with the application of econometric techniques to substantive areas of economics econometric research in the traditional divisions of the discipline or in the newly developing areas of social

experimentation are decidedly within the range of the journal's interests

David F. Hendry is a seminal figure in modern econometrics; he has pioneered the *LSE* approach to econometrics and his influence is wide-ranging. This book is a collection of papers dedicated to him and his work. Many internationally renowned econometricians who have collaborated with Hendry or have been influenced by his research have contributed to this volume, which provides a reflection on the recent advances in econometrics and considers the future progress for the methodology of econometrics. Central themes of the book include dynamic modelling and the properties of time series data, model selection and model evaluation, forecasting, policy analysis, exogeneity and causality, and encompassing. The book strikes a balance between econometric theory and empirical work and demonstrates the influence that Hendry's research has had on the direction of modern econometrics. Contributors include Karim Abadir, Anindya Banerjee, Gunnar Bårdsen, Andreas Beyer, Mike Clements, James Davidson, Juan Dolado, Jurgen Doornik, Robert Engle, Neil Ericsson, Jesus Gonzalo, Clive Granger, David Hendry, Kevin Hoover, Søren Johansen, Katarina Juselius, Steven Kamin, Pauline Kennedy, Maozu Lu, Massimiliano Marcellino, Laura Mayoral, Grayham Mizon, Bent Nielsen, Ragnor Nymoen, Jim Stock, Pravin Trivedi, Paolo Paruolo, Mark Watson, Hal White, and David Zimmer.

This paper comprehensively investigates long-run monetary neutrality in Japan with due consideration to the order of integration of the money stock and real output, mainly using long-term time series data retroactively available from the Meiji era (1868–1912). The empirical results indicate little evidence against the long-run neutrality of money, especially defined as  $M2$  with respect to real GNP. In addition, such findings are robust to a wide range of identifying assumptions.

We provide a robustness check of the US Phillips curve in the frequency domain. We design frequency-specific coefficients of correlation (FSCC) and regression (FSCR) based on our frequency-specific data extraction procedure, being real-valued, signed, and normalised. The FSCC is superior to traditional indicators such as coherence and cospectrum. Our FSCC and FSCR estimates suggest that the Phillips tradeoffs vary greatly across frequencies, with frequent sign reversals. They seem to be stable in higher frequencies but unstable in low and medium frequencies and are sensitive to the level and boundaries of frequency aggregation, to the way data are processed prior to analysis (e.g. detrending), and to the type of variables used. In this sense, the Phillips curves are fragile. The impact of potential cross-frequency model inconsistency on model estimation using conventional time-domain methods needs careful scrutiny.
