this research topic is the second volume of the community series in neurobiological biomarkers for developing novel treatments of substance and non substance addiction please see the first volume here many people suffer from substance from nicotine or alcohol to heroin methamphetamine cocaine etc or non substance from gaming gambling to shopping internet smartphone etc addiction both types of addiction are associated with severe health economic and social consequences and are far too often result in both familial and personal tragedies unfortunately current treatments are not very effective for

either substance or non substance addiction so novel treatments are desperately needed for example for nicotine addiction despite very well documented health risks of cigarette smoking and its economic and societal costs globally more than 30 of males still smoke and although many smokers desire to quit only approximately 5 30 will achieve abstinence with 6 months or more of the best available current treatments and the story for nicotine addiction is far from unique presenting a huge challenge for the entire addiction field therefore there is a vital need to improve outcomes for the treatment of both substance and non substance addictions recent work exploring neurobiological mechanisms of the treatment response at the molecular cellular and systems levels with a broad range of technologies such as magnetic resonance imaging mri genetics and genomics have opened new avenues for developing novel treatments through the detection of neurobiological biomarkers predicting efficacious outcomes in addicted patients
