investment science is designed for the core theoretical finance course in quantitative investment and for those individuals interested in the current state of development in the field what the essential ideas are how they are represented how they are represented how they can be used in actual investment practice and where the field might be headed in the future the coverage is similar to more intuitive texts but goes much farther in terms of mathematical content featuring varying levels of mathematical sophistication throughout the emphasis of the text is on the fundamental principles and how they can be mastered and transformed into solutions of important and interesting investment problems end of the chapter exercises are also included and unlike most books in the field investment science does not concentrate on institutional detail but instead focuses on methodology

a mathematical model consists of decision variables a goal function and constraints the region of possible solutions for a nonlinear mathematical model is the set of vectors whose components satisfy all constraints the optimal solution is the vector whose components satisfy all constraints and at which the function reaches an optimal value maximum or minimum nonlinear programming constitutes an important and fundamental part of operations research and is more comprehensive than linear programming its applications have spread across all branches of science including engineering physics chemistry management economics and military fields among others nonlinear programming can also be used in forecasting estimation applied statistics and determining the costs resulting from the production purchase and storage of goods given this importance and in order to obtain a more accurate solution that takes into account all the changes that the system under study may be exposed to we have previously presented a neutrosophic study of nonlinear models and some of the methods used to find the optimal solution in addition to what we have previously done in a research we present an improvement to the gradient projection method used to find the optimal solution for nonlinear models constrained by equal constraints enabling us to obtain the optimal solution in fewer steps we will then apply it to find the solution optimization of nonlinear neutrosophic
