this is the second volume of a 2 volume textbook which evolved from a course mathematics 160 offered at the california institute of technology during the last 25 years the

second volume presupposes a background in number theory comparable to that provided in the first volume together with a knowledge of the basic concepts of complex analysis most of the present volume is devoted to elliptic functions and modular functions with some of their number theoretic applications among the major topics treated are rademacher's convergent series for the partition function lehner's congruences for the fourier coefficients of the modular function j and hecke's theory of entire forms with multiplicative fourier coefficients the last chapter gives an account of bohr's theory of equivalence of general dirichlet series both volumes of this work emphasize classical aspects of a subject which in recent years has undergone a great deal of modern development it is hoped that these volumes will help the nonspecialist become acquainted with an important and fascinating part of mathematics and at the same time will provide some of the background that belongs to the repertory of every specialist in the field this volume like the first is dedicated to the students who have taken this course and have gone on to make notable contributions to number theory and other parts of mathematics t m a january 1976 the first volume is in the springer verlag series undergraduate texts in mathematics under the title introduction to analytic number theory

this book is a revised and enlarged edition of linear algebraic groups published by w a benjamin in 1969 the text of the first edition has been corrected and revised accordingly this book presents foundational material on algebraic groups lie algebras transformation spaces and quotient spaces after establishing these basic topics the text then turns to solvable groups general properties of linear algebraic groups and chevalley's structure theory of reductive groups over algebraically closed groundfields the remainder of the book is devoted to rationality questions over non algebraically closed fields this second edition has been expanded to include material on central isogenies and the structure of the group of rational points of an isotropic reductive group the main prerequisite is some familiarity with algebraic geometry the main notions and results needed are summarized in a chapter with references and brief proofs

it has become apparent during discussions with students and colleagues in forest genetics that a universal concern is the achievement of diverse goals of forestry from fiber production in industrial as well as farm forests to conserving forest ecosystems although we generally have several breeding methods available and several species to breed we seek to satisfy multiple use goals on diverse sites by management techniques that at best can only partially control edaphic environmental variation the dominant approach which was agriculturally motivated has involved intensive effort with complicated breeding plans on single species for uniform adaptability and single product plantations however this is obviously neither the only nor necessarily the best solution for the genetic management of tree species and thus our intent in this volume is to develop ways to achieve multiple objectives in tree breeding we include an array of breeding plans from simple iterated designs to sets of multiple populations capable of using gene actions for different traits in different environments for uncertain futures the presentation is organized around the development of breeding from single to multiple option plans from single to multiple traits from single to multiple environments and from single to multiple populations however it is not a complete how to book and includes neither exercises nor instructions on data handling it also does not include discussion of all modes of reproduction and inheritance encountered in plants

linear programming and its applications is intended for a first course in linear programming preferably in the sophomore or junior year of the typical undergraduate curriculum the emphasis throughout the book is on linear programming skills via the algorithmic solution of small scale problems both in the general sense and in the specific applications where these problems naturally occur the book arose from lecture notes prepared during the years 1985 1987 while i was a graduate assistant in the department of mathematics at the pennsylvania state university i used a preliminary draft in a methods of management science class in the spring semester of 1988 at lock haven university having been extensively tried and tested in the classroom at various stages of its development the book reflects many modifications either suggested directly by students or deemed appropriate from responses by students in the classroom setting my primary aim in writing the book was to address common errors and difficulties as clearly and effectively as i could

the food analyst plays an important role in modern society stricter control over additives in food and concern about the effects of contamination of food by industrial and agricultural chemicals are among the developments which are leading to an increasing emphasis on detailed and accurate analysis of food however analysis of food is required for many reasons including detection of toxic components monitoring legislation detecting adulteration formulation of controlled diets controlling formulation during product development and detecting changes in food during storage and processing foods comprise a complex mixture of components and food analysis requires efficient

methods of separation with high sensitivity or specificity of detection although many food components are involatile or thermally labile and therefore not suitable for analysis by gas chromatography other components are volatile and this technique is the preferred analytical method developments in methods of derivatization injector design and column technology have also extended the applicability of gas chromatography to the analysis of relatively involatile compounds
