this book is intended as a continuation of my book parametrix method in the theory of differential complexes see 291 there we considered complexes of differential operators between sections of vector bundles and we strived more than for details although there are many applications to for maximal generality overdetermined systems such an approach left me with a certain feeling of dissatisfaction especially since a large number of interesting consequences can be obtained without a great effort the present book is conceived as an attempt to shed some light on these new applications we consider as a rule differential operators having a simple structure on open subsets of \mathbb{R}^n currently this area is not being investigated very actively possibly because it is already very highly developed actively cf for example the book of palamodov 213 however even in this well studied situation the general ideas from 291 allow us to obtain new results in the qualitative theory of differential equations and frequently in definitive form the greater part of the material presented is related to applications of the 1st rent series for a solution of a system of differential equations which is a convenient way of writing the green formula the culminating application is an analog of the theorem of vitushkin 303 for uniform and mean approximation by solutions of an elliptic system somewhat afield are several questions on ill posedness but the parametrix method enables us to obtain here a series of hitherto unknown facts

this report describes a new imposed solution transmissive boundary capability that has been made operational in the brl version of the airblast hull hydrodynamics code which can be used for 3 d blast loading computations on rigid structures until this time 3 d blast loading computations have been done by either mapping a 2 d blast wave into the 3 d grid and assigning simple transmissive boundaries or by imposing a planar constant value non decaying wave or by imposing a decaying wave as defined by the lamb coding the boundary values for these input waves could only be imposed at two or three of the boundaries the new imposed solution boundaries for 3 d cartesian coordinates allow the time dependent definition of flow field conditions to be imposed at all six boundary planes the flow field conditions for these planes may be obtained from a previously run 2 d cylindrical hull computation through the use of a new program hullup this new capability permits better definition of free field flow conditions at boundaries and thus extends the time that a given grid will produce results on a target that are uncontaminated by artificial waves from improperly defined boundaries listings of the changes to hull the hullup program and sample runstreams for hullup keel and hull are included
