the distance formula in noncommutative geometry was introduced by connes at the end of the 1980s it is a generalization of riemannian geodesic distance that makes sense in a noncommutative setting and provides an original tool to study the geometry of the space of states on an algebra it also has an intriguing echo in physics for it yields a metric interpretation for the higgs field in the 1990s rieffel noticed that this distance is a noncommutative version of the wasserstein distance of order 1 in the theory of optimal transport more exactly this is a noncommutative generalization of kantorovich dual formula of the wasserstein distance connes

distance thus offers an unexpected connection between an ancient mathematical problem and the most recent discovery in high energy physics the meaning of this connection is far from clear yet riefel s observation suggests that connes distance may provide an interesting starting point for a theory of optimal transport in noncommutative geometry this volume contains several review papers that will give the reader an extensive introduction to the metric aspect of noncommutative geometry and its possible interpretation as a wasserstein distance on a quantum space as well as several topic papers
