modeling of chemical reactions covers detailed chemical kinetics models for chemical reactions including a comprehensive treatment of pressure dependent reactions

which are frequently not incorporated into detailed chemical kinetic models and the use of modern computational quantum chemistry which has recently become an extraordinarily useful component of the reaction kinetics toolkit it is intended both for those who need to model complex chemical reaction processes but have little background in the area and those who are already have experience and would benefit from having a wide range of useful material gathered in one volume the range of subject matter is wider than that found in many previous treatments of this subject the technical level of the material is also quite wide so that non experts can gain a grasp of fundamentals and experts also can find the book useful a solid introduction to kinetics material on computational quantum chemistry an important new area for kinetics contains a chapter on construction of mechanisms an approach only found in this book

this second extended and updated edition presents the current state of kinetics of chemical reactions combining basic knowledge with results recently obtained at the frontier of science special attention is paid to the problem of the chemical reaction complexity with theoretical and methodological concepts illustrated throughout by numerous examples taken from heterogeneous catalysis combustion and enzyme processes of great interest to graduate students in both chemistry and chemical engineering

the aim of this workshop on selectivity in chemical reactions was to examine the specific preferences exhibited by simple chemical reactions with regards to reagents having particular energy states symmetries alignment and orientation and the resulting formation of certain products with their corresponding energies states alignment and polarisation such problems come close to the ultimate goal of reaction dynamics of being able to determine experimentally and theoretically state to state cross sections and stereochemical effects under well defined and characterised conditions there are many examples of highly selective and specific processes to be found in atmospheric and combustion chemistry and the production of population inversions amongst vibrational and electronic states lies at the heart of the development of chemical laser systems only when we can understand the fundamental processes that underlie the selectivity in the formation of products in a chemical reaction and the specific requirements of initial states of the reagents can we expect to be able to develop the explanatory and predictive tools necessary to apply the subject to the development of new laser systems efficient combustion schemes and specific methods of chemical synthesis to the control of atmospheric pollution and to all problems in which it is necessary to direct the outcome of a chemical reaction in a specific way the brief given to the workshop was to critically review the field to discuss the present limitations and difficulties and to identify new directions

the document is intended as an introduction to the study of chemical reactions in moving ideal gas mixtures it has two distinct aims namely 1 to present an adequate summary of the principles of classical chemical kinetics which is intelligible to investigators without previous training in chemical kinetics 2 to provide the necessary basic material for intelligent formulation of flow problems with chemical reactions author

pharmaceutical and fine chemical products are typically synthesised batchwise which is an anomaly since batch processes have a series of practical and economical disadvantages on the contrary flow continuous processes present a series of advantages leading to new ways to synthesise chemical products flow processes enable control reaction parameters more precisely temperature residence time amount of reagents and solvent etc leading to better reproducibility safer and more reliable processes can be performed more advantageously using immobilized reagents or catalysts improve the selectivity and productivity of the process and possibly even the stability of the catalyst offer opportunities for heat exchange and energy conservation as well as an easy separation and recycling of the reactants and products by adequate process design achieve multistep syntheses by assembling a line of reactors with minimum or no purification in between two reaction steps can be assured by facile automation scale up can be easily conducted by number up with all the new research activity in manufacturing chemical products this comprehensive book is very timely as it summarises the latest trends in organic synthesis it gives an insight into flow continuous processes outlining the basic concepts and explaining the terminology of and systems approach to process design dealing with both homogeneous and heterogeneous catalysis and mini or micro reactors the book contains case studies extensive bibliographies and reference lists in each chapter to enable the reader to grasp the contents and to go on to more detailed texts on specific subjects if desired the book is written by both organic chemists and engineers giving a multidisciplinary vision of the new tools and methodologies in this field it is essential reading for organic chemists in industry or academia working alongside chemical engineers or who want to undertake chemical engineering projects it will also be of interest for chemical engineers to see how basic engineering concepts are applied in modern organic chemistry
