the emerging field of using geospatial technology to teach science and environmental education presents an excellent opportunity to discover the ways in which educators use research grounded pedagogical commitments in combination with their practical experiences to design and implement effective teacher professional development projects often missing from the literature are in depth explicit discussions of why and how educators choose to provide certain experiences and resources for the teachers with whom they work and the resulting outcomes the first half of this book will enable science and environmental educators to share the nature and structure of large scale professional development projects while discussing the theoretical commitments that undergird their work many chapters will include temporal aspects that present the ways in which projects change over time in response to evaluative research and practical experience in the second half of the book faculty and others whose focus is on national and international scales will share the ways in which they are working to meet the growing needs of teachers across the globe to incorporate geospatial technology into their science teaching these efforts reflect the ongoing conversations in

science education geography and the geospatial industry in ways that embody the opportunities and challenges inherent to this field this edited book will serve to define the field of teacher professional development for teaching science using geospatial technology as such it will identify short term and long term objectives for science environmental and geography educators involved in these efforts as a result this book will provide a framework for future projects and research in this exciting and growing field

the full potential of geophysics in engineering investigations is still to be realised the many available techniques can provide important information about the ground its mass properties its small scale variations and its anomalies of structure or content the advantage of a geophysical survey is that it enables information to be obtained for large volumes of ground that cannot be investigated by direct methods due to cost the applications of geophysics in the characterisation of contaminated land are still developing but have great potential for example in the distribution and migration of pollutants in the ground and groundwater geophysics is still insufficiently or inappropriately used in engineering and the newer capabilities are not appreciated so there is a need for up to date guidance about how to apply geophysical investigations this report is published in co operation with the geological society and presents a logical guide through the process of using geophysical investigation methods in site characterisation it explores the roles of geophysical methods and provides the background to geophysics as an investigative tool the procurement management and reporting frameworks for a geophysical investigation are set out and the importance of the involvement of a recognised geophysics specialist adviser with the work is emphasised the report explains the need for a conceptual ground model to enable appropriate investigative methods to be chosen the underlying science and current practices of the main techniques are explained as well as the processes of data acquisition handling and presentation the different targets determinable by geophysical methods are considered in separate sections for geological geotechnical geo environmental and structural engineering applications the report concludes with recommendations for practice the guide is aimed at geotechnical and civil engineers geologists and engineering geologists specialist geophysics contractors consultants and clients
