the structure and function of animal cell components an introductory text provides an introduction to the study of animal cells specifically the structure and function of the cells to help readers appreciate the discussions this book first provides an introduction to the physiological and biochemical function of animal cells which is followed by an introduction to animal cell structure this text then presents topics on the components of the cells such as the mitochondria and the nucleus and processes in the cells including protein synthesis this selection will be invaluable to cytologists anatomists and pathologists as well as to readers who have an elementary knowledge of both biochemistry and cytology

since the second half of the 20th century machine computations have played a critical role in science and engineering computer based techniques have become especially important in molecular biology since they often represent the only viable way to gain

insights into the behavior of a biological system as a whole the complexity of biological systems which usually needs to be analyzed on different time and size scales and with different levels of accuracy requires the application of different approaches ranging from comparative analysis of sequences and structural databases to the analysis of networks of interdependence between cell components and processes through coarse grained modeling to atomically detailed simulations and finally to molecular quantum mechanics this book provides a comprehensive overview of modern computer based techniques for computing the structure properties and dynamics of biomolecules and biomolecular processes the twenty two chapters written by scientists from all over the world address the theory and practice of computer simulation techniques in the study of biological phenomena the chapters are grouped into four thematic sections dealing with the following topics the methodology of molecular simulations applications of molecular simulations bioinformatics methods and use of experimental information in molecular simulations and selected applications of molecular quantum mechanics the book includes an introductory chapter written by harold a scheraga one of the true pioneers in simulation studies of biomacromolecules

advanced characterization of nanostructured materials probing the structure and dynamics with synchrotron x rays and neutrons is a collection of chapters which review the characterization of the structure and internal dynamics of a wide variety of nanostructured materials using various synchrotron x ray and neutron scattering techniques it is intended for graduate students and researchers who might be interested in learning about and applying these methods the authors are well known practitioners in their fields of research who provide detailed and authoritative accounts of how these techniques have been applied to study systems ranging from thin films and monolayers on solid surfaces and at liquid air liquid liquid and solid liquid interfaces nanostructured composite materials battery materials and catalytic materials while there have been a great many books published on nanoscience there are relatively few that have discussed in one volume detailed synchrotron x ray and neutron methods for advanced characterization of nanomaterials in thin films composite materials catalytic and battery materials and at interfaces this book should provide an incentive and a reference for researchers in nanomaterials for using these techniques as a powerful way to characterize their samples it should also help to popularize the use of synchrotron and neutron facilities by the nanoscience community
