osteosarcoma os is the most common primary bone tumor with a bimodal age distribution the highest incidence is in children and adolescents and the second highest is among older adults 60 years surgery and neoadjuvant chemotherapy are the main clinical treatments for os yet the 5 year survival rate is just 20 for

individuals with metastases or recurrent os most standard treatments were established in the 1980s which can achieve long term survival in approximately 60 of patients with localized os however in the face of inoperable surgery we are still limited in what we can do for os patients who are insensitive or intolerant to chemotherapy drugs resistance to chemotherapeutic drugs is also a problem that hinders breakthroughs in os treatment although survival rates have not improved during the past four decades the heterogeneity and potential molecular aberrations of os have been revealed as the biology of os has come to be better understood with the recent advancements in molecular profiling technology for os new technologies and concepts are undergoing sublimation
