processes and methods for project monitoring and control earned value management is studied to measure the project performance throughout the life of a project and to estimate the expected project time and cost based on the current status of the project how to incorporate inflation into the analysis is presented in chapter 11 qualitative and quantitative techniques including decision trees simulation and software applications are introduced risk phases are defined and building a risk register is addressed an example risk breakdown structure is presented the design of risk management processes is introduced and risk response planning strategies are discussed at the end of the chapter the quantitative risk analysis is demonstrated at the hand of a team discussion case study chapter 12 covers several models and approaches dealing with various stochastic aspects of the decision environment stochastic models generation of robust schedules use of reactive and fuzzy approaches are presented sensitivity and scenario analysis are introduced also simulation analysis which is widely used to analyze the impacts of uncertainty on project goals is presented chapter 13 addresses repetitive projects that involve the production or construction of similar units in batches such as railway cars or residential houses particularly in the construction industry repetitive projects represent a large portion of the work accomplished in this sector of the economy a case study on the 50 km section of a motorway project is used for demonstrating the handling of repetitive project management how best to select one or more of a set of candidate projects to maintain a project portfolio is an important problem for project based organizations with limited resources the project selection problem is inherently a multi objective problem and is treated as such in chapter 14 several models and solution techniques are introduced a multi objective multi period project selection and scheduling model is presented a case study that addresses a project portfolio selection and scheduling problem for the construction of a set of dams in a region is presented finally chapter 15 discusses three promising research areas in project management in detail i sustainability and project management ii project management in the era of big data and iii the fourth industrial revolution and the new age project management we elaborate on the importance of sustainability in project management practices discuss how developments in data analytics might impact project life cycle management and speculate how the infinite possibilities of the fourth industrial revolution and the new technologies will transform project management practices

relational data exchange is the problem of translating relational data according to a given specification it is one of the many tasks that arise in information integration a fundamental issue is how to answer queries that are posed against the result of the data exchange so that the answers are semantically consistent with the source data for monotonic queries the certain answers semantics by fagin kolaitis miller and popa 2003 yields good answers for many non monotonic queries however this semantics was shown to yield counter intuitive answers this dissertation deals with the problem of computing the certain answers to monotonic queries on the one hand on the other hand it presents and compares semantics for answering non monotonic queries and investigates how hard it is to evaluate non monotonic queries under these semantics

aaai proceedings describe innovative concepts techniques perspectives and observations that present promising research directions in artificial intelligence the annual aaai national conference provides a forum for information exchange and interaction among researchers from all disciplines of ai contributions include theoretical experimental and empirical results topics cover principles of cognition perception and action the design application and evaluation of ai algorithms and systems architectures and frameworks for classes of ai systems and analyses of tasks and domains in which intelligent systems perform distributed for aaai press

an introduction to the methods of designing algorithms for hard computing tasks concentrating mainly on approximate randomized and heuristic algorithms and on the theoretical and experimental comparison of these approaches according to the requirements of the practice this is the first book to systematically explain and compare all the main possibilities of attacking hard computing problems it also closes the gap between theory and practice by providing at once a graduate textbook and a handbook for practitioners dealing with hard computing problems
