the 9th international symposium on insect plant relationships sip 9 was once more following the tradition established in 1958 a forum for investigators in both basic and applied entomology interested in the important and fascinating field of interactions between plants and insects we were pleased and honoured to organise this symposium which took place june 24 30 1995 in gwatt on the shores of the lake of thun in switzerland 168 participants from 26 countries from all over the world actively took part in the symposium by contributing 12 key note lectures and a total of 141 oral presentations and posters the favourable response and the lively interaction of the participants in all symposium activities is the clearest indication of the success of sip 9 the organisers appreciated the enthusiasm and the willingness to collaborate shown by all participants the following volume contains written contributions 72 of only half of all presentations this is due to the fact that we decided to produce not only an account of the proceedings but also to publish all contributions as a special volume of the journal entomologia experimentalis et applicata this procedure was last adopted in 1978 for sip 4 organised by reginald f chapman and elizabeth a bernays and ensures a wide distribution of the papers within the scientific community and easy access through libraries inevitably we had to employ the same review procedure as applicable for the manuscripts regularly submitted to entomologia

this book studies when a prime p can be written in the form $x^2 + ny^2$ it begins at an elementary level with results of fermat and euler and then discusses the work of lagrange legendre and gauss on quadratic reciprocity and the genus theory of quadratic forms after exploring cubic and biquadratic reciprocity the pace quickens with the introduction of algebraic number fields and class field theory this leads to the concept of ring class field and a complete but abstract solution of $p = x^2 + ny^2$ to make things more concrete the book introduces complex multiplication and modular functions to give a constructive solution the book ends with a discussion of elliptic curves and shimura reciprocity along the way the reader will encounter some compelling history and marvelous formulas together with a complete solution of the class number

one problem for imaginary quadratic fields the book is accessible to readers with modest backgrounds in number theory in the third edition the numerous exercises have been thoroughly checked and revised and as a special feature complete solutions are included this makes the book especially attractive to readers who want to get an active knowledge of this wonderful part of mathematics

this volume presents modern trends in the area of symmetries and their applications based on contributions to the workshop lie theory and its applications in physics held in sofia bulgaria in june 2023 traditionally lie theory is a tool to build mathematical models for physical systems recently the trend is towards geometrization of the mathematical description of physical systems and objects a geometric approach to a system yields in general some notion of symmetry which is very helpful in understanding its structure geometrization and symmetries are meant in their widest sense i e representation theory algebraic geometry number theory infinite dimensional lie algebras and groups superalgebras and supergroups groups and quantum groups noncommutative geometry symmetries of linear and nonlinear partial differential operators special functions and others furthermore the necessary tools from functional analysis are included this is a large interdisciplinary and interrelated field the topics covered in this volume from the workshop represent the most modern trends in the field representation theory symmetries in string theories symmetries in gravity theories supergravity conformal field theory integrable systems polylogarithms and supersymmetry they also include supersymmetric calogero type models quantum groups deformations quantum computing and deep learning entanglement applications to quantum theory and exceptional quantum algebra for the standard model of particle physics this book is suitable for a broad audience of mathematicians mathematical physicists and theoretical physicists including researchers and graduate students interested in lie theory

this book is a printed edition of the special issue lie theory and its applications that was published in symmetry
