john e freund s mathematical statistics is a calculus based introduction to the mathematics of statistics this edition deals in greater depth with some of the applications of the theory

this text is listed on the course of reading for soa exam p and for the cas exam st probability and statistics with applications a problem solving text is an introductory textbook designed to make the subject accessible to college freshmen and sophomores concurrent with their study of calculus the book provides the content to serve as the primary text for a standard two semester advanced undergraduate course in mathematical probability and statistics it is organized specifically to meet the needs of students who are preparing for the society of actuaries and casualty actuarial society qualifying examination p 1 and the statistics component of cas exam 3l sample actuarial exam problems are integrated throughout the text along with an abundance of illustrative examples and 799 exercises the chapters on

mathematical statistics cover all of the learning objectives for the statistics portion of the casualty actuarial society exam st syllabus here again liberal use is made of past exam problems from cas exams 3 and 31 a separate solutions manual for the text exercises is also available

this text is designed primarily for a two semester or three quarter calculus based course in mathematical statistics

mathematical statistics typically represents one of the most difficult challenges in statistics particularly for those with more applied rather than mathematical interests and backgrounds most textbooks on the subject provide little or no review of the advanced calculus topics upon which much of mathematical statistics relies and furthermore contain material that is wholly theoretical thus presenting even greater challenges to those interested in applying advanced statistics to a specific area mathematical statistics with applications presents the background concepts and builds the technical sophistication needed to move on to more advanced studies in multivariate analysis decision theory stochastic processes or computational statistics applications embedded within theoretical discussions clearly demonstrate the utility of the theory in a useful and relevant field of application and allow readers to avoid sudden exposure to purely theoretical materials with its clear explanations and more than usual emphasis on applications and computation this text reaches out to the many students and professionals more interested in the practical use of statistics to enrich their work in areas such as communications computer science economics astronomy and public health

many mathematical statistics texts are heavily oriented toward a rigorous mathematical development of probability and statistics without much attention paid to how statistics is actually used in contrast modern mathematical statistics with applications second edition strikes a balance between mathematical foundations and statistical practice in keeping with the recommendation that every math student should study statistics and probability with an emphasis on data analysis accomplished authors jay devore and kenneth berk make statistical concepts and methods clear and relevant through careful explanations and a broad range of applications involving real data the main focus of the book is

on presenting and illustrating methods of inferential statistics that are useful in research it begins with a chapter on descriptive statistics that immediately exposes the reader to real data the next six chapters develop the probability material that bridges the gap between descriptive and inferential statistics point estimation inferences based on statistical intervals and hypothesis testing are then introduced in the next three chapters the remainder of the book explores the use of this methodology in a variety of more complex settings this edition includes a plethora of new exercises a number of which are similar to what would be encountered on the actuarial exams that cover probability and statistics representative applications include investigating whether the average tip percentage in a particular restaurant exceeds the standard 15 considering whether the flavor and aroma of champagne are affected by bottle temperature or type of pour modeling the relationship between college graduation rate and average sat score and assessing the likelihood of o ring failure in space shuttle launches as related to launch temperature

mathematical statistics with applications in r third edition offers a modern calculus based theoretical introduction to mathematical statistics and applications the book covers many modern statistical computational and simulation concepts that are not covered in other texts such as the jackknife bootstrap methods the em algorithms and markov chain monte carlo mcmc methods such as the metropolis algorithm metropolis hastings algorithm and the gibbs sampler by combining discussion on the theory of statistics with a wealth of real world applications the book helps students to approach statistical problem solving in a logical manner step by step procedure to solve real problems make the topics very accessible presents step by step procedures to solve real problems making each topic more accessible provides updated application exercises in each chapter blending theory and modern methods with the use of r includes new chapters on categorical data analysis and extreme value theory with applications wide array coverage of anova nonparametric bayesian and empirical methods

mathematical statistics with applications provides a calculus based theoretical introduction to mathematical statistics while emphasizing interdisciplinary applications as well as exposure to modern statistical computational and simulation concepts that are not covered in other textbooks includes the jackknife bootstrap methods the em algorithms and markov chain monte carlo methods prior probability or statistics knowledge is not required step by step procedure to solve real problems making the topic more accessible exercises blend theory and modern applications practical real world chapter projects provides an optional section in each chapter on using minitab spss and sas commands

this is a new edition of a very successful introduction to statistical methods for general insurance practitioners no prior statistical knowledge is assumed and the mathematical level required is approximately equivalent to school mathematics whilst the book is primarily introductory the authors discuss some more advanced topics including simulation calculation of risk premiums credibility theory estimation of outstanding claim provisions and risk theory all topics are illustrated by examples drawn from general insurance and references for further reading are given solutions to most of the exercises are included for the new edition the opportunity has been taken to make minor improvements and corrections throughout the text to rewrite some sections to improve clarity and to update the examples and references a new section dealing with estimation has also been added

this is the most widely used mathematical statistics text at the top 200 universities in the united states premiere authors dennis wackerly william mendenhall and richard l scheaffer present a solid undergraduate foundation in statistical theory while conveying the relevance and importance of the theory in solving practical problems in the real world the authors use of practical applications and excellent exercises helps students discover the nature of statistics and understand its essential role in scientific research

a thorough and definitive book that fully addresses traditional and modern day topics of nonparametric statistics this book presents a practical approach to nonparametric statistical analysis and provides comprehensive coverage of both established and newly developed methods with the use of matlab the authors present information on theorems and rank tests in an applied fashion with an emphasis on modern methods in regression and curve fitting bootstrap confidence intervals splines wavelets empirical likelihood and goodness of fit testing nonparametric statistics with applications to science and engineering begins with succinct coverage of basic results for order statistics methods of categorical data analysis nonparametric regression and curve fitting methods the authors then focus on nonparametric procedures that are becoming more relevant to engineering researchers and practitioners the important fundamental materials needed to

effectively learn and apply the discussed methods are also provided throughout the book complete with exercise sets chapter reviews and a related site that features downloadable matlab applications this book is an essential textbook for graduate courses in engineering and the physical sciences and also serves as a valuable reference for researchers who seek a more comprehensive understanding of modern nonparametric statistical methods
