the last forty years of research have demonstrated that working memory wm is a key concept for understanding higher order cognition to give an example wm is involved in reading comprehension problem solving and reasoning but also in a number of everyday life activities it has a clear role in the case of atypical development too for instance numerous studies have shown an impairment in wm in individuals with learning disabilities ld or intellectual disabilities id and several researchers have hypothesized that this can be linked to their difficulties in learning cognition and everyday life the latest challenge in the field concerns the trainability of wm if it is a construct central to our understanding of cognition in typical and atypical development then specific intervention

to sustain wm performance might also promote changes in cognitive processes associated with wm the idea that wm can be modified is debated however partly because of the theoretical implications of this view and partly due to the generally contradictory results obtained so far in fact most studies converge in demonstrating specific effects of wm training i e improvements in the trained tasks but few transfer effects to allied cognitive processes are generally reported it is worth noting that any maintenance effects when investigated are even more meagre in addition a number of methodological concerns have been raised in relation to the use of 1 single tasks to assess the effects of a training program 2 wm tasks differing from those used in the training to assess the effects of wm training and 3 passive control groups these and other crucial issues have so far prevented any conclusions from being drawn on the efficacy of wm training bearing in mind that the opportunity to train wm could have a huge impact in the educational and clinical settings it seems fundamentally important to shed more light on the limits and potential of this line of research the aim of the research discussed here is to generate new evidence on the feasibility of training wm in individuals with ld and id there are several questions that could be raised in this field for a start can wm be trained in this population are there some aspects of wm that can be trained more easily than others can a wm training reduce the impact of ld and id on learning outcomes and on everyday living what kind of training program is best suited to the promotion of such changes

work so fundamental to well being has its darker and more costly side work can adversely affect our health well beyond the usual counts of injuries that we think of as occupational health the ways in which work is organized its pace and intensity degree of

control over the work process sense of justice and employment security among other things can be as toxic to the health of workers as the chemicals in the air these work characteristics can be detrimental not only to mental well being but to physical health scientists refer to these features of work as hazards of the psychosocial work environment one key pathway from the work environment to illness is through the mechanism of stress thus we speak of stressors in the work environment or work stress this is in contrast to the popular psychological understandings of stress which locate many of the problems with the individual rather than the environment in this book we advance a social environmental understanding of the workplace and health the book addresses this topic in three parts the important changes taking place in the world of work in the context of the global economy part i scientific findings on the effects of particular forms of work organization and work stressors on employees health unhealthy work as a major public health problem and estimates of costs to employers and society part ii and case studies and various approaches to improve working conditions prevent disease and improve health part iii
