il testo termofisica per ingegneri è stato da me edito nell ormai lontano 1974 con l'intendimento di porgere al lettore la materia strutturata in maniera tale da poter costituire il supporto cartaceo per il corso di fisica tecnica che allora tenevo in forma intensiva per gli allievi della sezione meccanica della facoltà di ingegneria dell università di bologna

modeling of the rainfall runoff process is of both scientific and practical significance many of the currently used mathematical models of hydrologic systems were developed a generation ago much of the effort since then has focused on refining these models rather than on developing new models based on improved scientific understanding in the past few years however a renewed effort has been made to improve both our fundamental understanding of hydrologic processes and to exploit technological advances in computing and remote sensing it is against this background that the nato advanced study institute on recent advances in the modeling of hydrologic systems was organized the idea for holding a nato asi on this topic grew out of an informal discussion between one of the co directors and professor francisco nunes correia at a previous nato asi held at tucson arizona in 1985 the special program panel on global transport mechanisms in the geo sciences of the nato scientific affairs division agreed to sponsor the asi and an organizing committee was formed the committee comprised the co directors professor david s bowles u s a and professor p enda o connell u k and professor francisco nunes correia portugal dr donn g decoursey u s a and professor ezio todini italy

the liquid state is possibly the most difficult and intriguing state of matter to model organic liquids are required mainly as working fluids in almost all industrial activities and in most appliances e g in air conditioning transport properties namely dynamic viscosity and thermal conductivity are possibly the most important properties for the design of devices and appliances most theoretical studies on the liquid state date back to the fifties however huge advances in experimental studies and applied research on heat and mass transfer in liquids have been achieved during past decades most of the models cannot rely on theory alone and are empirical while for most organic liquids only a few experimental points and empirical correlations are available in literature the aim of this book is to present both theoretical approaches and the latest experimental advances on the issue and to merge them into a wider approach the book is organised into five chapters the first chapter presents our theoretical knowledge of the liquid state the second presents the tentative models for the evaluation of the thermal conductivity of organic liquids and confronts their results with the experimental data available in literature the third presents the tentative models for the evaluation of the dynamic viscosity of organic liquids and confronts their results with the experimental data available in literature the fourth presents a deeper review of the choice methods for thermal conductivity and their applications to mixtures of organic liquids and the fifth chapter presents a deeper review of the choice methods for dynamic viscosity and their applications to mixtures of organic liquids
